33575 (DOE/ER/40150–211) **Alignment of CEBAF cryomodules.** Schneider, W.J.; Bisognano, J.J.; Fischer, J. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. Jun 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-PR–93-017;CONF-930511–240: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017505. Source: OSTI; NTIS; INIS; GPO Dep.

CEBAF, the Continuous Electron Beam Accelerator Facility, when completed, will house a 4 GeV recirculating accelerator. Each of the accelerator's two linacs contains 160 superconducting radio frequency (SRF) 1497 MHz niobium cavities in 20 cryomodules. Alignments of the cavities within the cryomodule with respect to beam axis is critical to achieving the optimum accelerator performance. This paper discusses the rationale for the current specification on cavity mechanical alignment: 2 mrad (rms) applied to the 0.5 m active length cavities. We describe the tooling that was developed to achieve the tolerance at the time of cavity pair assembly, to preserve and integrate alignment during cryomodule assembly, and to translate alignment to appropriate installation in the beam line.

33576 (DOE/ER/40150–212) **Performance of production SRF cavities for CEBAF.** Reece, C.; Benesch, J.; Kneisel, P.; Kushnick, P.; Mammosser, J.; Powers, T. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-PR–93-018;CONF-930511–268: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017367. Source: OSTI; NTIS; INIS; GPO Dep.

Construction of the Continuous Electron Beam Accelerator Facility recirculating linac represents the largest scale application of superconducting rf (SRF) technology to date. Over 250 of the eventual 338 SRF 1497 MHz cavities have been assembled into hermetic pairs and completed rf testing at 2.0 K. Although the rf performance characteristics well exceed the CEBAF baseline requirements of $Q_0 = 2.4 \times 10^9$ at 5 MV/m, the usual limiting phenomena are encountered field emission, quenching, Q-switching, will occasional multipacting. An analysis of the occurrence conditions and severity of these phenomena during production cavity testing is presented. The frequency with which performance is limited by quenching suggests that additional material advances may be required for applications which require the reliable achievement of accelerating gradients of more than 15 MV/m. The distributions of frequency and Q for a higher-order mode are also presented.

33577 (DOE/ER/40150–219) **Beam raster system at CEBAF.** Yan, C.; Beaufait, J.; Brindza, P.; Carlini, R.; Vulcan, W.; Wines, R. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-PR–93-005). Order Number DE93014225. Source: OSTI; NTIS; INIS; GPO Dep.

A cascade raster system will be used to generate variable rastering pattern on polarized target, cryogenic hydrogen target, and the beam dump with adjustable frequency up to 10 kHz and variable deflection angle from 0.05 mr to 1 mr. Each raster consists of two air-core bedstead coils providing transverse and vertival scans. The magnets are energized by individual MOS power amplifiers being controlled by the scan generator which determines frequency, amplitude, and phase shift between the cascade rasters.

33578 (DOE/ER/40150–220) **Beam energy measurement using the ARC beam line as a spectrometer.** Yan, C.; Carlini, R.; Neuffer, D. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-PR–93-004). Order Number DE93014226. Source: OSTI; NTIS; INIS; GPO Dep.

The use of the Hall C achromatic arc line as an energy analyser is proposed. It has a dispersion of 12cm/% with all the quadrupoles, sextupoles, and beam correctors switched off. The transverse position and the angle of the beam at the entrance of the arc is precisely measured by a pair of wire scanners spaced by 2.5 m, and the transverse position of the outgoing beam is measured by another pair of wire scanners at the exit of the arc. After the absolute beam energy is measured, the arc will be turned into normal achromat mode by energizing all the elements and the beam position probe located at the mid-point of the arc is used to monitor the beam energy in the operational mode. A complete error analysis shows that an absolute beam energy measurement with 10^{-3} accuracy can be achieved. Relative energy measurements at the 10^{-4} level are also obtainable.

33579 (DOE/ER/40150–224) **Performance of a 1500 MHz niobium cavity with 2K-LHe channel cooling.** Susta, J.; Kneisel, P.; Wiseman, M. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CONF-930511–294: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993; CEBAF-PR–93-024). Order Number DE93017452. Source: OSTI; NTIS; INIS; GPO Dep.

β=1 superconducting accelerator structures are traditionally operated immersed in a liquid helium bath. Nevertheless, several attempts have been made in the past to make use of the numerous operational and cost advantages of a pipe-cooling configuration: reduction in liquid helium inventory, minimized cooldown/warmup times, and elimination of the LHe-vessel, which reduces the sensitivity to microphonics and provides easier access to all cavity components. This paper reports on tests performed with a 1500 MHz niobium cavity with 2K-LHe cooling channels covering only a fraction of the cavity surface. The cooling channels are made of niobium to preserve the capability for high temperature treatments. In the initial test the cavity was immersed in a helium bath; subsequently the cooling was only provided by superfluid helium in the cooling channels. The experimental results are compared to thermal model calculations. In addition, the computer

model is used to investigate the variations in cavity performance as a function of the cooling channel geometry and thermal conductivity properties of the niobium.

33580 (DOE/ER/40150–226) **Integrated numerical modeling of a laser gun injector.** Liu, H.; Benson, S.; Bisognano, J.; Liger, P.; Neil, G.; Neuffer, D.; Sinclair, C.; Yunn, B. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-PR–93-029;CONF-930511–317: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017820. Source: OSTI; NTIS; INIS; GPO Dep.

CEBAF is planning to incorporate a laser gun injector into the linac front end as a high-charge cw source for a high-power free electron laser and nuclear physics. This injector consists of a DC laser gun, a buncher, a cryounit and a chicane. The performance of the injector is predicted based on integrated numerical modeling using POISSON, SUPERFISH and PARMELA. The point-by-point method incorporated into PARMELA by McDonald is chosen for space charge treatment. The concept of "conditioning for final bunching" is employed to vary several crucial parameters of the system for achieving highest peak current while maintaining low emittance and low energy spread. Extensive parameter variation studies show that the design will perform beyond the specifications for FEL operations aimed at industrial applications and fundamental scientific research. The calculation also shows that the injector will perform as an extremely bright cw electron source.

33581 (DOE/ER/40150–T2) **Performance of a CEBAF production cavity after high-temperature heat treatment.** Kneisel, P.; Rao, M. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. Jun 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-PR–93-023). Order Number DE93017915. Source: OSTI; NTIS; INIS; GPO Dep.

CEBAF's production cavities are tested in a vertical configuration after appropriate chemical surface treatment prior to installation into the accelerator. The performance of these cavities is excellent, often exceeding the specifications of E_{acc}=5 MV/m at 2 K by factors of 2 to 3. In such cases the cavities are often limited by thermal-magnetic breakdown. A cavity that exhibited a limiting gradient of $E_{acc} \leq$ 16.4 MV/m has been heat-treated at 1400°C for 6 hours in the presence of titanium as a solid state gettering material to improve the thermal stability of the niobium. After the heat treatment a gradient of E_{acc}=20.5 MV/m corresponding to a peak surface electric field of E_{peak}=52 MV/m has been measured. In addition to the cavity results, data on thermal conductivity and tensile properties of samples which have undergone the same treatments as the cavity are reported.

33582 (DOE/ER/40541–1) **SSC detector muon sub-system beam tests.** Downing, R. (Illinois Univ., Urbana, IL (United States). Dept. of Physics); Errede, S.; Gauthier, A.; Haney, M.; Karliner, I.; Liss, T.; O'Halloran, T.; Sheldon, P.; Simiatis, V.; Thaler, J.; Wiss, J.; Green, D.; Martin, P.; Morfin, J.; Kunori, S.; Skuja,.Washington Univ., Seattle, WA (United States). Dept. of Physics. [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40541. Order Number DE93018415. Source: OSTI; NTIS; INIS; GPO Dep.

We propose to start a test-beam experiment at Fermilab studying the problems associated with tracking extremely high energy muons through absorbers. We anticipate that in this energy range the observation of the muons will be complicated by associated electromagnetic radiation Monte Carlo simulations of this background need to be tuned by direct observations. These beam tests are essential to determine important design parameters of a SSC muon detector, such as the choice of the tracking, geometry, hardware triggering schemes, the number of measuring stations, the amount of iron between measuring stations, etc. We intend to begin the first phase of this program in November of 1990 utilizing the Tevatron muon beam. We plan to measure the multiplicity, direction, and separation of secondary particles associated with the primary muon track as it emerges from an absorber. The second phase of beam test in 1992 or later will be a full scale test for the final design chosen in our muon subsystem proposal.

33583 (DOE/FTR–93012116) **[Cryostat project meetings and vendor visits in Italy and Germany]: Foreign trip report, September 7–22, 1992.** Nicol, T.H. Fermi National Accelerator Lab., Batavia, IL (United States). 23 Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93012116. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was three-fold. First, to attend a cryostat working group meeting of the TESLA collaboration at INFN-Frascati, second to visit an Italian cryostat vendor whose charge is to design and fabricate cryostats for the TESLA test cell, and third to attend a scheduled TESLA collaboration workshop at DESY.

33584 (DOE/FTR–93017244) **Travel to England to discuss final design of the CLAS TORUS: Foreign trip report, June 5–10, 1992.** O'Meara, J.E.; Tuzel, W.; Bonneau, P.R. Southeastern Universities Research Association, Inc., Newport News, VA (United States). 15 Jun 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. Order Number DE93017244. Source: OSTI; NTIS (US Sales Only); GPO Dep.

CEBAF visited Oxford Instrument, June 8 and 9, 1992, to discuss remain issues of final design of the CLAS TORUS. The following technical subjects were discussed during this meeting: Superconducting circuit design; coil structure; cryogenic and vacuum system; and power supply and control.

33585 (DOE/FTR–93017246) **Travel to Europe concerning quadrupole designs at Saclay: Foreign trip report, December 3, 1992–March 7, 1993.** Alcorn, J.; Gavalya, A. Southeastern Universities Research Association, Inc., Newport News, VA (United States). 21 Jul 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. Order Number DE93017246. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses the preliminary design of quadrupole magnets for the CEBAF accelerator.

33586 (FNAL/C–93/132) **Reliability of the Fermilab Antiproton Source.** Harms, E. Jr. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–308: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017807. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reports on the reliability of the Fermilab Antiproton source since it began operation in 1985. Reliability of the complex as a whole as well as subsystem performance is summarized. Also discussed is the trending done to determine causes of significant machine downtime and actions taken to reduce the incidence of failure. Finally, results of a study to detect previously unidentified reliability limitations are presented.

33587 (FNAL-TM–1790) **Beam transfer at E0: An overview.** Saritepe, S. (Superconducting Super Collider Lab., Dallas, TX (United States)); Annala, G. Fermi National Accelerator Lab., Batavia, IL (United States). 25 Jun 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93017814. Source: OSTI; NTIS; INIS; GPO Dep.

The helical orbits in the Tevatron necessitated changes in the beam transfer operation between the Main Ring and the Tevatron. This document is intended to present an overview of the beam transfer with an emphasis on the recent changes. It will also serve as a bibliography for the other documents that exist on Tevatron injection.

33588 (FNAL-TM–1791) **Tevatron reverse injection.** Saritepe, S. (Superconducting Super Collider Lab., Dallas, TX (United States)); Annala, G. Fermi National Accelerator Lab., Batavia, IL (United States). 25 Jun 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93017813. Source: OSTI; NTIS; INIS; GPO Dep.

In the new injection scenario antiprotons are injected onto a helical orbit in the Tevatron in order to avoid the detrimental effects of the beam-beam interaction at 150 GeV. The new scenario required

changes in the tuning procedure. Antiprotons are too precious to be used for tuning, therefore the antiproton injection line has to be tuned with protons by reverse injecting them from the Tevatron into the Main Pang (MR). Previously, the reverse injection was performed in one supercycle. One batch of uncoalesced bunches was injected into the Tevatron and ejected after 40 seconds. Then the orbit closure was performed in the MR. In the new scheme the lambertson magnets have to be moved and separator polarities have to be switched, activities that cannot be completed in one supercycle. Therefore, the reverse injection sequence was changed. This involved the redefinition of TVBS dock event $D8 as MRBS $D8 thus marking it possible to inject 6 proton batches and eject them one at a time on command, performing orbit closure each time in the MR.

33589 (FNAL-TM–1836) **Electrical design note for a 5000 ADC, 230 μH power supply filter choke.** Visser, A.T. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93014015. Source: OSTI; NTIS; INIS; GPO Dep.

This note describes the design of a 5000 ADC, 230 μH choke made from standard transformer cores. Five of these chokes have been made for CDF and MTF. NOTE: Special magnets can also be made using standard cores.

33590 (FNAL-TM–1847) **Impedance issue of corrugated beam pipe from CDF.** Ng, King-Yuen. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93017815. Source: OSTI; NTIS; INIS; GPO Dep.

The CDF collaboration proposed to install a new corrugated beam pipe at the Tevatron interaction area in order to better monitor the interaction vertex. This note discuss the impedance implication of such a pipe.

33591 (INIS-RU–347, pp. 387) **Improvement of the axial-symmetrical magnetic lens characteristics.** Balashov, V.I. (Kazakhskij Gosudarstvennyj Univ., Alma-Ata (Kazakhstan)); Fisenko, S.I. Estimations of neutron beam intensity production under electromagnetic desintegration of deuterons in amorphous cristalline targets are presented. 5 refs.; 2 figs.

33597 (KEK–92-17) **Accelerator shielding benchmark problems.** Hirayama, H. (and others); Ban, S.; Nakamura, T. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jan 1993. 166p. Order Number DE93520300. Source: OSTI; NTIS; INIS.

Accelerator shielding benchmark problems prepared by Working Group of Accelerator Shielding in the Research Committee on Radiation Behavior in the Atomic Energy Society of Japan were compiled by Radiation Safety Control Center of National Laboratory for High Energy Physics. Twenty-five accelerator shielding benchmark problems are presented for evaluating the calculational

algorithm, the accuracy of computer codes and the nuclear data used in codes. (author).

33598 (KEK–92-18) **Study on interstrand coupling losses in Rutherford-type superconducting cables.** Lei, Y.Z.; Shintomi, T.; Terashima, A.; Hirabayashi, H. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1993. 23p. Order Number DE93520301. Source: OSTI; NTIS; INIS.

Two sets of experimental apparatus for measuring the AC losses in superconducting strands and Rutherford-type cable conductors have been constructed. A few strand samples and a number of compacted cable samples with and without a CuMn matrix have been measured. The hysteresis loss, loss from coupling within strands and loss from coupling between strands in cables have been distinguished from each other. The results show that, even for Rutherford cables without any soldering and coating, their AC losses may be quite different from each other due to the variation of the interstrand coupling loss. For cables without a CuMn matrix, interstrand coupling loss increases nearly according to a geometrical series with an increase of curing temperature simulating coil fabrication. However, cables with the CuMn matrix show a relatively small curing temperature dependence. For most of the samples, losses do not show any evident dependence on the mechanical pressure. Interstrand resistances in one of these cables have also been measured; the results indicate that the tendency for a decrease in the interstrand resistances is consistent with the results of AC loss measurements. (author).

33599 (KEK-PR–92-2) **KENS report - 9, 1991/92.** Misawa, M.; Masuda, Y.; Ikeda, S. (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). 1992. 268p. Order Number DE93520302. Source: OSTI; NTIS; INIS.

The present issue follows a previous issue, KENS Report-VIII published in December 1990 and summarizes research progress at the KENS facility during the period between October 1990 and September 1992. During this period a great deal of efforts was devoted to improve the performance of the existing instruments. The construction of a small and medium-Q instrument, WINK, is almost completed and the instrument has successfully been utilized for the measurement of the micro void structure in SiC fiber, a new material. A glass and liquid spectrometer, HIT, which was very productive over past twelve years, retired recently and a new instrument, HIT-II, has just been installed at the position. A high-resolution powder diffractometer, HRP, is also one of the most productive instrument although this is a prototype one for instrumental development. A new instrument, HRP-II, is under construction, which will be installed at the experimental hall by September 1993. Developing research for new techniques also progressed. One highlight was the development of a ^{3}He polarizer. A polarization of about 50 % has already been attained. By increasing the laser power a higher polarization, hopefully more than 80 %, will be achieved in near future. (author).

33600 (KEK-PROC–92-4, pp. 380-389) **Hydrogen depth profile of Al-alloy vacuum chamber exposed to synchrotron radiation.** Kanazawa, K. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Yanokura, M.; Aratani, M.; Akiyama, H. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). May 1992. (CONF-9203224–: 8. meeting on ultra high vacuum techniques for accelerators and storage rings, Tsukuba (Japan), 12-13 Mar 1992). In *Proceedings of the 8th meeting on ultra high vacuum techniques for accelerators and storage rings.* 464p. Order Number DE93764168. Source: OSTI; NTIS; INIS.

Hydrogen depth profile was measured for an Al-alloy vacuum chamber of the TRISTAN accumulation ring, which had been exposed to synchrotron radiation over 6 years. By analyzing the energy of hydrogen atoms elastically recoiled by 52.28 MeV argon beam, a dense hydrogen concentration near the surface is observed. The most dense part of the observed hydrogen is considered to correspond to a surface oxide layer of aluminium. The surface irradiated directly with synchrotron radiation shows the least hydrogen content which is about 1/10 of an un-irradiated surface. This observation gives a direct evidence for the assumption that for an aluminium chamber, hydrogen desorbed during exposure to synchrotron radiation has its origin in a surface oxide layer. (author).

33601 (LA-UR–93-2450) **Circuit modeling and component trimming to achieve performance requirements for the DARHT prototype injector.** Melton, J.G. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930616–16: 9. IEEE pulsed power conference, Albuquerque, NM (United States), 21-23 Jun 1993). Order Number DE93018353. Source: OSTI; NTIS; INIS; GPO Dep.

To produce an acceptable electron beam, the Dual-Axis Radiographic Hydrodynamic Test (DARHT) Facility accelerators require high-voltage pulses that are flat to within ±1% for 65±ns. Achieving this accuracy and pulse duration in operation on the Integrated Test Stand (a full-scale prototype of the DARHT 4-Mev injector and first eight linear induction accelerator cells) has required fine-tuning selected components in the injector pulsed power circuits. Several circuit analysis codes are used to analyze circuit performance and to predict the effects of component changes. Four cases are presented. (1) The center conductor of an ethylene glycol transmission line was tapered to compensate for a 4-5% tilt of the flat-top portion of the injector voltage waveform. (2) The mixture of water-glycol solution used in the Blumlein "peaking" section was changed to compensate for a 2% hump in the flat-top portion of the voltage waveform. (3) Confirmation was provided that observed changes in pulse shape could be caused by changes in dielectric constant of the ethylene glycol used in the Blumlein, caused by hygroscopic absorption of water vapor. (4) A damping resistor was added in series with the Blumlein center conductor to reduce the amplitude of low-frequency, post-pulse oscillations that were causing late-time flash-overs of the vacuum insulator.

33602 (LA-UR–93-2675) **Investigations of the electrical breakdown properties of insulator materials used in high voltage vacuum diodes.** Shurter, R.P.; Carlson, R.L.; Melton, J.G. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930616–17: 9. IEEE pulsed power conference, Albuquerque, NM (United States), 21-23 Jun 1993). Order Number DE93018461. Source: OSTI; NTIS; GPO Dep.

The Injector for the proposed Dual-Axis Radiographic Hydrodynamic Testing (DARHT) Facility at Los Alamos utilizes a monolithic insulator deployed in a radial configuration. The 1.83-m-diam × 25.4-cm-thick insulator with embedded grading rings separates the output oil transmission line from the vacuum vessel that contains the re-entrant anode and cathode assemblies. Although much work has been done by the pulse power community in studying surface flash-over of insulating materials used in both axial and radial configurations, dendrite growth at the roots of grading rings embedded in materials suitable for very large insulators is less well characterized. Degradation of several acrylic insulators has been observed in the form of dendrites growing at the roots of the grading rings for large numbers (100's) of pulses on the prototype DARHT Injector and other machines using similar radial geometries. In a few cases, these dendrites have led to catastrophic bulk breakdown of the acrylic between two grading rings making the insulator a costly loss. Insulating materials under investigation are acrylic (Lucite), epoxy (Furane), and cross-linked polystyrene (Rexolite); each of these materials has its own particular mechanical and electrical merits. All of these materials have been cast and machined into the required large size for the Injector. Test methods and the results of investigations into the breakdown strength of various interface geometries and the susceptibility of these materials to dendrite growth are reported.

33603 (LBL–33190) **The Phase Servo Tuner Control system of the ALS 500 MHz cavity.** Lo, C.C.; Taylor, B. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–344: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993; LSGN–105). Order Number DE93018713. Source: OSTI; NTIS; INIS; GPO Dep.

Three 500 MHz cavities are used in the Booster and Storage Ring of the Advanced Light Source (ALS). Due to different varying parameters, a control system is required to keep the cavities in tune during operation. The tuning of the 500 MHz cavity is achieved by detecting the phase error between the drive signal

and the cavity probe signal. The error signal is amplified and used to drive a stepping motor which in turn moves a metallic cylinder in or out of the cavity to achieve tuning.

33604 (LBL–33197) **First undulators for the Advanced Light Source.** Hoyer, E.; Akre, J.; Chin, J. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–343: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993; LSGN–103). Order Number DE93018700. Source: OSTI; NTIS; INIS; GPO Dep.

The first three undulators, each 4.6 m in length, for the Advanced Light source (ALS) at Lawrence Berkeley Laboratory (LBL), are near completion and are undergoing qualification tests before installation into the storage ring. Two devices have 5.0-cm period lengths, 89 periods, and achieve an effective field of 0.85 T at the 14 mm minimum magnetic gap. The other device has a period length of 8.0 cm, 55 periods, and an effective field of 1.2 T at the minimum 14 mm gap. Measurements on the first 5 cm period device show the uncorrelated field errors to be 0.23%, which is less than the required 0.25%. Measurements of gap control show reproducibility of ±5 microns or better. The first vacuum chamber, 5.0 m long, is flat to within 0.53 mm over the 4.6 m magnetic structure section and a 4×10^{-11} Torr pressure was achieved during vacuum tests. Device description, fabrication, and measurements are presented.

33605 (LBL–33221) **Final analysis of the ALS lattice magnet data.** Keller, R. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–331: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018705. Source: OSTI; NTIS; INIS; GPO Dep.

A preliminary analysis of the measured magnet data of the multipole magnets to be installed in the Advanced Light Source (ALS) storage ring had been given in the last conference of this series. That analysis was based on measurements of about one-third of the entire magnet complement, and some of its findings had to be revised after obtaining more data. The present paper gives an account of the integrated fundamental field strengths of all installed storage ring lattice magnets. For the multipole magnets, these values are listed as analytical expressions with four or five parameters, that cover the entire excitation range and include residual strength. Based on this final analysis, all gradient and quadrupole magnets were qualified for installation, whereas the sextupole magnets had to be individually trimmed to bring their effective fundamental strengths into the desired tolerance band.

33606 (LBL–33224) **Flux shunts for undulators.** Hoyer, E. (Lawrence Berkeley Lab., CA (United States)); Chin, J.; Hassenzahl, W.V. Lawrence Berkeley Lab., CA (United States); Lawrence Livermore National Lab., CA (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–325: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018535. Source: OSTI; NTIS; INIS; GPO Dep.

Undulators for high-performance applications in synchrotron-radiation sources and periodic magnetic structures for free-electron lasers have stringent requirements on the curvature of the electron's average trajectory. Undulators using the permanent magnet hybrid configuration often have fields in their central region that produce a curved trajectory caused by local, ambient magnetic fields such as those of the earth. The 4.6 m long Advanced Light Source (ALS) undulators use flux shunts to reduce this effect. These flux shunts are magnetic linkages of very high permeability material connecting the two steel beams that support the magnetic structures. The shunts reduce the scalar potential difference between the supporting beams and carry substantial flux that would normally appear in the undulator gap. Magnetic design, mechanical configuration of the flux shunts and magnetic measurements of their effect on the ALS undulators are described.

33607 (LBL–33254) **Magnet costs for the Advanced Light Source.** Tanabe, J.; Krupnick, J.; Hoyer, E.; Paterson, A. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–352: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018709. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Light Source (ALS) accelerator is now completed. The numerous conventional magnets required for the booster ring, the storage ring and the low and high energy transfer lines were installed during the last two years. This paper summarizes the various costs associated with the quantity fabrication of selected magnet families. These costs include the costs of prototypes, tooling, coil and core fabrication, assembly and magnetic measurements. Brief descriptions of the magnets and specialized requirements for magnetic measurements are included in order to associate the costs with the relative complexities of the various magnet systems.

33608 (LBL–33283) **K^+ ion source for the heavy ion induction Linac System Experiment ILSE.** Eylon, S.; Henestroza, E.; Chupp, W.W.; Yu, S. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–568;CONF-930511–348: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018536. Source: OSTI; NTIS; INIS; GPO Dep.

Low emittance singly charged potassium thermionic ion sources are being developed for the ILSE injector. The ILSE, now under study at LBL, will address the physics issues of particle beams in a heavy ion fusion driver scenario. The K^+ ion beam is emitted thermionically into a diode gap from alumina-silicate layers (zeolite) coated uniformly on a porous tungsten cup. The Injector diode design requires a large diameter (4in. to 7in.) source able to deliver high current (~800 mA) low emittance ($E_n < .5\ \pi$ mm-mr) beam. The SBTE (Single Beam Test Experiment) 120 keV gun was redesigned and modified with the aid of diode optics calculations using the EGUN code to enable the extraction of high currents of about 90 mA out of a one-inch diameter source. We report on the 1in. source fabrication technique and performance, including total current and current density profile measurements using Faraday cups, emittance and phase space profile measurements using the double slit scanning technique, and life time measurements. Furthermore, we shall report on the extension of the fabricating technique to large diameter sources (up to 7in.), measured ion emission performance, measured surface temperature uniform heating power considerations for large sources.

33609 (LBL–33290) **The Advanced Light Source (ALS) Radiation Safety System.** Ritchie, A.; Oldfather, D.; Lindner, A. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–353: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018708. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Light Source (ALS) at the Lawrence Berkeley Laboratory (LBL) is a 1.5 GeV synchrotron light source facility consisting of a 120 keV electron gun, 50 MeV linear accelerator, 1.5 Gev booster synchrotron, 200 meter circumference electron storage ring, and many photon beamline transport systems for research. The Radiation Safety System for the ALS has been designed and built with a primary goal of providing protection against inadvertent personnel exposure to gamma and neutron radiation and, secondarily, to enhance the electrical safety of select magnet power supplies.

33610 (LBL–33291) **The ALS Storage Ring RF System.** Taylor, B.; Lo, C.C.; Baptiste, K.; Guigli, J.; Julian, J. Lawrence Berkeley Lab., CA (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–324: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018534. Source: OSTI; NTIS; INIS; GPO Dep.

The ALS Storage Ring RF System is characterized by the use of the following features: (1) High power loading of two single cell cavities. (2) The use of a tubular ceramic input window employing aperture coupling. (3) The use of waveguide filters and matchers

designed for HOM absorption. (4) A comprehensive HOM monitoring system. (5) The use of waveguide water-wedge loads for the magic tee and circulator loads. The results of cavity measurements and high power tests are reported together with the performance of the system during the commissioning and operation phases of the ALS project. Plans for future window development are discussed.

33611 (LBL–33292) **Performance of Advanced Light Source particle beam diagnostics.** Hinkson, J. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–342: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993; LSGN–123). Order Number DE93018699. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Light Source (ALS), a third-generation synchrotron radiation facility, is complete. The particle beam diagnostics have been installed and tested. The beam injection systems have been running for two years. We have performance data on beam position monitors, beam intensity monitors, scintillators, beam collimators, a 50 Ω Faraday cup, and broad-band striplines and kickers used in the linac, transport lines, and the booster synchrotron. The single-turn monitoring capability of the booster beam position monitoring system has been particularly useful for studying beam dynamics. Beam diagnostics for the storage ring are being commissioned. In this paper we describe each instrument, show its performance, and outline how the instruments are controlled and their output data displayed.

33612 (LBL–33294) **Magnet power supply system for the ALS storage ring and booster.** Jackson, L.T.; Luchini, K.; Lutz, I. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–338: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993; LSGN–128). Order Number DE93018702. Source: OSTI; NTIS; INIS; GPO Dep.

The Magnet Power Supply System is described by specification, design, hardware, and operating experience. A unique system for the one Hz, 1.5 GeV Booster, where the wideband QF and QD power supplies track the dipole current to within 0.1% at injection will be detailed. AC distribution system considerations related to inverting the stored energy of the booster magnet back into power grid will be discussed. The rational for linear correctors and individual quad supplies (225 total units) will be placed within the context of the storage-ring requirements.

33613 (LBL–33315) **ILSE-ESQ injector scaled experiment.** Henestroza, E. (Lawrence Berkeley Lab., CA (United States)); Eylon, S.; Yu, S.; Grote, D. Lawrence Berkeley Lab., CA (United States); Lawrence Livermore National Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–575;CONF-930511–355: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018707. Source: OSTI; NTIS; INIS; GPO Dep.

A 2 MeV, 800 mA, K^+ injector for the Heavy Ion Fusion Induction Linac Systems Experiments (ISLE) is under development at LBL. It consists of a 500 keV-1MeV diode preinjector followed by an electrostatic quadrupole accelerator (ESQ). One of the key issues for the ESQ centers around the control of beam aberrations due to the "energy effect": in a strong electrostatic quadrupole field, ions at beam edge will have energies very different from those on the axis. The resulting kinematic distortions lead to S-shaped phase spaces, which, if uncorrected, will lead eventually to emittance growth. These beam aberrations can be minimized by increasing the injection energy and/or strengthening the beam focusing. It may also be possible to compensate for the "energy effect" by proper shaping of the quadrupoles electrodes. In order to check the physics of the "energy effect" of the ESQ design a scaled experiment has been designed that will accommodate the parameters of the source, as well as the voltage limitations, of the Single Beam Transport Experiment (SBTE). Since the 500 keV pre-injector delivers a 4 cm converging beam, a quarter-scale experiment will fit the 1 cm converging beam of the SBTE source. Also, a 10 mA beam in SBTE, and the requirement of equal perveance in both systems, forces all the voltages to scale down by a factor 0.054. Results from this experiment and corresponding 3D PIC simulations will be presented.

33614 (ORNL/FTR–4203) **Travel to France to obtain operating experience with the CAPRICE ECR ion source: Foreign trip report, February 14–26, 1992.** Meyer, F.W. Oak Ridge National Lab., TN (United States). 19 Mar 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014400. Source: OSTI; NTIS (US Sales Only); GPO Dep.

During a one-week's stay with the PSI group headed by G. Melin at Centre d'Etudes Nucleaires-Grenoble, the traveler obtained operating experience with the CAPRICE ECR ion source; source performances for He, N, Ar, and Ta ions were measured and all found to meet or exceed the specifications defined in the ORNL purchase order for this source. During testing of the source, some weaknesses in the mechanical design of the source were identified, whose effect will be closely monitored once the source becomes operational at ORNL. After his stay at CEN-G, the traveler visited GANIL in Caen, France, to learn about recent ECR source developments there, in particular the ECR4 ion source, which is a modification of the Grenoble CAPRICE source. While having roughly the same performance as the CAPRICE source, the mechanical design has been significantly improved. However, earliest delivery time for an ECR4 source is about 18 months, due to prior commitments, compared to immediate delivery for the CAPRICE source. During the past year, a very compact, completely permanent magnet-based ECR source, called NANOGAN, has been developed at GANIL in connection with a proposed radioactive beams development program. This source has recently become operational, and has shown rather attractive performances; because of its very low power requirements, it will undoubtedly find application in many diverse settings.

33615 (PNL-SA–21926) **ACQUIRE: A data acquisition system for CAMAC on SUN workstation.** Kouzes, R.T.; Lowry, M.M. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930640–2: 8. IEEE conference on real-time computer applications in nuclear, particle and plasma physics, Vancouver (Canada), 8-11 Jun 1993). Order Number DE93017663. Source: OSTI; NTIS; INIS; GPO Dep.

The data acquisition software package ACQUIRE been used for many years by the Princeton University Cyclotron Laboratory for nuclear physics research applications. This code has been ported to the SUN Sparc workstation and is fully functional, including block data transfers using an in crate Event Handler. A SCSI interface to CAMAC is utilized, and the device handling software has been developed in such a way that little modification was needed in the ACQUIRE code for the SUN implementation. The Higz X windows graphics package from CERN is used for data display.

33616 (SSCL-Preprint–247) **Preliminary results from a study of collar lamination variation in SSC Prototype Dipole Magnets.** Gattu, R.; Brown, G.M.; Pollock, D. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–37: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014170. Source: OSTI; NTIS; INIS; GPO Dep.

The collar laminations used in SSC Prototype Collider Dipole Magnets determine the volume within which the magnet coils are constrained after collaring and keying. The uniformity and symmetry of the inside volume of the collars along the length of the magnet may have a significant influence on the field quality of the finished assembly. This paper describes an on-going Statistical Quality Control study of collar lamination dimensional variation being performed by SSCL Magnet Systems Division Quality Assurance. Samples of collars have been measured using a coordinate measuring machine evaluate manufacturing process capability as well as the overall uniformity of the inventory population of collar laminations. The collar data will be used to predict variation in the coil assembly center and radius for inner and outer top-bottom, left-right coil combinations well as pole angles. Collar results will

be combined with azimuthal coil size measurements part of a manufacturing cause and effect model for predicting axial geometric multipoles based on the observed mechanical variation. This work focuses on Prototype Collider Dipole Magnet DCA 102 currently being built at the SSCL MDL in Waxahachie, Texas. This magnet is being made on the same coil curing and collaring mold cavities that were used for the DCA 300 series magnets built at FNAL in 1991–1992 and which were later used in the 1992 Accelerator Systems String Test (ASST). The collars are part of the same procurement used for the DCA300 series magnets.

33617 (SSCL-Preprint–283) **Multilayer insulation for the interconnect region in the Accelerator System String Test: A practical engineering approach for a new scheme of design and installation bridges.** Baritchi, D.; Jalloh, A. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–95: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93018748. Source: OSTI; NTIS; INIS; GPO Dep.

In order to minimize the heat leak in the Accelerator System String Test (ASST) inter-connect region, shield bridges and multilayer insulation (MLI) are provided. A sliding joint between shield bridges on adjacent magnets accommodates the contraction that occurs during cooldown. In the original design of the MLI bridges, thermal contraction was provided for by compressing the MLI. During assembly of the interconnect region, it was realized that there was not enough room for the required compression. This resulted in a redesign of the MLI bridges. The new scheme involves splitting and overlapping the MLI. This scheme has worked very well in subsequent assembly of the interconnect region. In this paper, we are going to present the new design scheme. We will also compare this design with the original design and present its advantages.

33618 (SSCL-Preprint–303) **A study of the effect of cable insulation on coil properties.** Spindel, A.; Sims, R.; Bastian, S.; Pollock, D. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–89: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93018009. Source: OSTI; NTIS; INIS; GPO Dep.

Stacks of insulated superconducting cable were cured and tested for mechanical properties. Four different polyimide films were investigated in all polyimide insulation schemes. The effect of bottom layer material, top layer material and wrapping scheme on stack size, modulus, and compressive creep are reported.

33619 (SSCL-Preprint–307) **A methodology to describe process control requirements.** Carcagno, R.; Ganni, V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–93: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93018006. Source: OSTI; NTIS; GPO Dep.

This paper presents a methodology to describe process control requirements for helium refrigeration plants. The SSC requires a greater level of automation for its refrigeration plants than is common in the cryogenics industry, and traditional methods (e.g., written descriptions) used to describe process control requirements are not sufficient. The methodology presented in this paper employs tabular and graphic representations in addition to written descriptions. The resulting document constitutents a tool for efficient communication among the different people involved in the design, development, operation, and maintenance of the control system. The methodology is not limited to helium refrigeration plants, and can be applied with similar requirements. The paper includes examples.

33620 (SSCL-Preprint–316) **Summary of dipole field angle measurements on 50mm-aperture SSC Collider Dipole Magnet Protoypes.** Marks, J. (Superconducting Super Collider Lab., Dallas, TX (United States)); DiMarco, J.; Kuzminski, J.; Ogitsu, T.; Zheng, H.; Bleadon, M.; Kuchnir, M.; Schmidt, E.E.; Yu, Y. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–80: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93016887. Source: OSTI; NTIS; INIS; GPO Dep.

At several stages in the production of the SSC collider dipole magnets and their final installation the magnetic field angle needs to be known. A simple device using a permanent magnet which aligns itself with the magnetic field had been developed at FNAL to survey the direction of the magnetic dipole field with respect to the vertical (as determined by gravity) along the magnet axis. The determination of the dipole field angle was part of the field quality characterization of a series of thirteen full-length 50mm-aperture SSC Collider Dipole Magnet Prototypes which were built for R&D purposes at FNAL. Measurements with the first developed FAP system were performed on a regular basis through several stages of the magnet production process with the intention of fabrication quality control. Part of these included measurements performed before and after cryogenic testing: these data are summarized here. The performance of a second system with an improved probe and data acquisition system was tested on part of the DCA series as well. This paper includes a presentation of time stability, noise and angular resolution data of this second probe. Another alternative instrument to determine the dipole field angle is the "mole" rotating coil system developed at BNL used mainly to measure the multipole components of the magnetic field. In the case of magnet DCA320, a comparison is made between the field angle as determined by the mole and those determined by both of the FAPS.

33621 (SSCL-Preprint–317) **Mechanical analysis of the DSB cross-section.** Chen, Yanping. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–86: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93016892. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the preliminary mechanical finite element analysis for the SSCL designed DSB dipole magnet. This SSCL version 50 mm aperture dipole magnet is for the SSCL High Energy Booster with nineteen turns, three wedges for inner coil and twenty six turns, one wedge for outer coil, the round collar is nineteen mm thick, the yoke and the shell are adopted from the design for quadrupole QSEIO1. The main purposes of this mechanical study are to ensure that there are no excessive stresses in the cold mass under different loading, to avoid coils unloading from the collar at excitation of 6500 A, to ensure collar-to-yoke, line-to-line fit after welding the shell, and also to ensure the yoke midplane gaps are closed at an operating current of 6500 A. Therefore, the analyses performed include magnet assembly (collaring) to 69 Mpa azimuthal stress at the inner coil pole and 55 Mpa azimuthal stress at the outer coil pole; shell welding to 207 Mpa azimuthal stress in the shell; magnet cooldown to 4.25 K; and Lorentz excitation at a current of 6500 A.

33622 (SSCL-Preprint–335) **Engineered design of SSC cooling ponds.** Bear, J.B. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–104: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93019824. Source: OSTI; NTIS; INIS; GPO Dep.

The cooling requirements of the SSC are significant and adequate cooling water systems to meet these requirements are critical to the project's successful operation. The use of adequately designed cooling ponds will provide reliable cooling for operation while also meeting environmental goals of the project to maintain streamflow and flood peaks to preconstruction levels as well as other streamflow and water quality requirements of the Texas Water Commission and the Environmental Protection Agency.

33623 (SSCL-Preprint–336) **Design of a tunnel cooling system.** Cheng, A. (D'Escoto Associates, Dallas, TX (United States));

Dawson, R.; Zhao, R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–90: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93018007. Source: OSTI; NTIS; INIS; GPO Dep.

Based on a thermal analysis of the SSC main tunnel and requirements for space conditions in the underground electronics niches, thermal cooling systems will be required to reject the heat dissipated underground. Many system were considered and compared to decide the optimum solution. Construction documents are being prepared and contract administration will proceed as technical and non-technical objectives are pursued.

33624 (SSCL-Preprint–387) **Lamination and end pack design studies of SSC low energy booster magnet prototypes.** Li, N. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–67: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014101. Source: OSTI; NTIS; INIS; GPO Dep.

The SSC Laboratory plans to deploy two "large" detectors for the essential high-energy physics experiments at the initial startup of the collider. The GEM detector is optimized to emphasize precise measurement of photons and electrons, as well as precise tracking of high-energy muons. An essential part of the GEM detector is the magnet subsystem, which provides the magnetic field necessary for identification and high-resolution tracking of charged particles. This large superconducting magnet system, with ferromagnetic field-shapers, presents a variety of engineering challenges in superconductor technology, in magnet-winding technology, fabrication, assembly and installation of large and heavy components, and in ensuring the required high operating availability.

33625 (SSCL-Preprint–419) **2 TeV HEB beam abort at the SSCL.** Schailey, R.; Bull, J.; Clayton, T.; Kocur, P.; Mokhov, N. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–318: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018011. Source: OSTI; NTIS; INIS; GPO Dep.

The High Energy Booster (HEB) of the Superconducting Super Collider Laboratory (SSCL) will require a full aperture beam abort over a dynamic energy range of 200 GeV to 2 TeV. Since the HEB is a bi-polar machine, both clockwise (CW) and the counter-clockwise (CCW) beam aborts are required. Also, the stored beam energy of 6.55 MJ in the superconducting HEB imposes upon the full aperture requirement. In this report, we describe the abort channels in the HEB utility straight sections, aperture restrictions, mechanical interferences and solutions, kicker misfires, and a 1 TeV beam absorber.

33626 (SSCL-Preprint–449) **A liquid helium cryogenic system design for the GEM magnet.** Deis, G. (Lawrence Livermore National Lab., CA (United States)); Warren, R.P.; Richied, D.E.; Martovetsky, N.N.; Krupczak, J.J.; Sidi-Yekhlef, A.; Pace, J.R.; Collins, C.A. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486 ;W-7405-ENG-48. (UCRL-JC–114580;CONF-930703–11: International cryogenic engineering conference and international cryogenic materials conference, Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE93018004. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider (SSC) Gammas, Electrons, Muons (GEM) magnet is a large superconducting solenoid with a total mass of 1.05×10^6 kg and a stored energy of 2.5 G. A cryogenic system to cool and to maintain the GEM magnet to liquid helium temperature is described. The system is designed to operate effectively under a variety of operating conditions, including cooldown/warm-up, steady state operations, and quench. Primary cooling during steady-state operation is based on natural circulation thermosiphon flow through cooling tubes in the solenoid support bobbin. Additional cooling loops are included for lead and joint cooling and conductor stabilization. A helium refrigerator/liquefier rated at 2 kill and 20 g/s will be specified to meet the refrigeration requirements. Cooldown of the magnet from 300 K to liquid nitrogen temperatures is accomplished using a counterflow helium-to-liquid-nitrogen heat exchanger independent of the helium refrigerator. The system incorporates provisions for maintenance access during accelerator beam operation.

33627 (SSCL-Preprint–475) **Cold test facility for 1.8 m superconducting model magnets at the SSC.** LaBarge, A. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930703–16: International cryogenic engineering conference and international cryogenic materials conference, Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE93018759. Source: OSTI; NTIS; INIS; GPO Dep.

A new facility has been constructed to measure the characteristic features of superconducting model magnets and cable at cryogenic temperatures – a function which supports the design and development process for building full-scale accelerator magnets. There are multiple systems operating in concert to test the model magnets, namely: cryogenic, magnet power, data acquisition and system control. A typical model magnet test includes the following items: (1) warm measurements of magnet coils, strain gauges and voltage taps; (2) hipot testing of insulation integrity; (3) cooling with liquid nitrogen and then liquid helium; (4) measuring quench current and magnetic field; (5) magnet warm-up. While the magnet is being cooled to 4.22 K, the mechanical stress is monitored through strain gauges. Current is then ramped into the magnet until it reaches some maximum value and the magnet transitions from the superconducting state to the normal state. Normal-zone propagation is monitored using voltage taps on the magnet coils during this process, thus indicating where the transition began. The current ramp is usually repeated until a plateau current is reached, where the magnet has mechanically settled.

33628 (SSCL-Preprint–478) **Data Acquisition for detector prototypes at the SSCL.** Botlo, M.; Jagielski, M.; Miller, L.; Romero, A. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930640–3: 8. IEEE conference on real-time computer applications in nuclear, particle and plasma physics, Vancouver (Canada), 8-11 Jun 1993). Order Number DE93018012. Source: OSTI; NTIS; INIS; GPO Dep.

We report on the design and implementation of a Data Acquisition System for experimental setups within the Physics Research Division of the Superconducting Super Collider. The design of the system is driven by the requirements of flexibility, modularity, portability, and safety. We emphasize off the shelf hard- and software such as Motorola 68040 and RISC based processors, standard data links, and accepted packages such as X-windows and the real-time operating system VxWorks. We discuss both the quantitative and qualitative performance of our system and conclude with a brief review of current research and development in areas such as slow controls and Data-Machine Independence.

33629 (SSCL-Preprint–487) **An engineering design study of alternative design options for the forward toroids of the SSC SDC detector.** Dittert, L. (ICF Kaiser Engineers, Inc., Oakland, CA (United States)); Western, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–102: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93019741. Source: OSTI; NTIS; INIS; GPO Dep.

The Muon Forward Toroids (MFTs) are 3-meter-thick sections of magnetized iron located at both ends of the detector proposed by the Solenodial Detector Collaboration (SDC). The forward calorimeter and the outer muon chamber layers are supported by the MFT. This paper investigates viable and cost effective construction alternatives for the MFTs.

33630 (SSCL-SR–1223) **Radiation environment and shielding for the GEM experiment at the SSC.** Diwan, M.; Fisyak, Y.; Mokhov, N. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93018650. Source: OSTI; NTIS; INIS; GPO Dep.

We have performed a comprehensive study of the radiation environment for the proposed GEM detector at the SSC. As a result of this study, we have developed a shielding scenario that will ensure that the detector will operate with its design performance for at least 10 years at the luminosity of 10^{33} $cm^{-2}s^{-1}$.

33631 (UCRL-JC–112224) **Optimum current densities from high current H^- and D^- sources.** Hiskes, J.R. Lawrence Livermore National Lab., CA (United States). 4 Nov 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921145–9: Production and neutralization of negative ions and beams, Upton, NY (United States), 9-13 Nov 1992). Order Number DE93018070. Source: OSTI; NTIS; INIS; GPO Dep.

The tandem system, with the electron energy distribution arranged spatially and with electron energies decreasing toward the exit aperture, will generate a five-fold enhancement in extracted current density when compared to an optimal single-chamber system. With the increased understanding of the underlying atomic processes, together with a body of experience in the operation high-power hydrogen and deuterium discharges, it has now become possible to specify in absolute terms the optimal current-density performance of a hydrogen/deuterium system. A variation on the single-chamber and tandem systems has been purposed that employs a single-chamber, pulsed discharge. Following the discharge pulse, the transient variation of the electron energy distribution allows for a more optimal generation of negative ions than does the static single-chamber system. Some of the limitations of this system when compared with the steady-state tandem system are discussed here.

33632 (UCRL-JC–112245) **PIC space-charge emission with finite Δt and Δz.** Hewett, D.W.; Chen, Yu-Jiuan. Lawrence Livermore National Lab., CA (United States). 22 Feb 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930269–16: Computational accelerator physics conference (CAP93), Pleasanton, CA (United States), 22-26 Feb 1993). Order Number DE93018103. Source: OSTI; NTIS; INIS; GPO Dep.

A new algorithm for space charge emission has been developed to provide the correct (to a few percent) Child-Langmuir steady-state current limits as the number of mesh points in the voltage gap drops to O(10). Further, the transient behavior of such flows compares well with idealized, analytic cases, lending confidence as we extend these algorithms into full RZ geometry with curved emitting surfaces to investigate transient characteristics of realistic injector designs.

33633 (UCRL-JC–114625) **Optimum extracted H^- and D^- current densities from gas-pressure-limited high-power hydrogen/deuterium tandem ion sources.** Hiskes, J.R. Lawrence Livermore National Lab., CA (United States). 14 Jul 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9308136–1: 5. international conference on ion sources, Peking (China), 31 Aug - 4 sep 1993). Order Number DE93018090. Source: OSTI; NTIS; INIS; GPO Dep.

The tandem hydrogen/deuterium ion source is modelled for the purpose of identifying the maximum current densities that can be extracted subject to the gas-pressure constraints proposed for contemporary beam-line systems. Optimum useful extracted current densities are found to be in the range of approximately 7 to 10 mA cm^{-2}. The sensitivity of these current densities is examined subject to uncertainties in the underlying atomic/molecular rate processes; A principal uncertainty remains the quantification of the molecular vibrational distribution following H_{3+} wall collisions.

4304 Storage Rings

33634 (ANL/ASD/CP–78366) **Circuit description of unipolar DC-to-DC converters for APS storage ring quadrupoles and sextupoles.** McGhee, D.G. Argonne National Lab., IL (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–306: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017743. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the control, interlock, and power circuits for 680 unipolar switch mode DC-to-DC converters used to regulate the Advanced Photon Sources (APS's) storage ring quadrupole and sextupole magnet currents. Quadrupole current stability is $\pm 6\times10^{-5}$ and the sextupole current stability is $\pm3\times10^{-4}$. The stability is obtained with pulse width modulation, operating at a switching frequency of 20kHz with full current switching. The converters are housed in 200 cabinets located on top of the storage ring tunnel. Raw DC power is distributed from 80 AC-to-DC power supplies, four at each of 20 locations around the storage ring. Voltages, currents, and temperatures are computer monitored and logged for the converters and magnets. All converters and magnets are water cooled with the flow and pressure monitored at the inlet and outlet of groups. Water is interlocked with the raw power supplies and not the individual converters.

33635 (ANL/ASD/VU–78335) **HOM (higher-order mode) test of the storage ring single-cell cavity with a 20-MeV e^- beam for the Advanced Photon Source (APS).** Song, J.; Kang, Y.W.; Kustom, R. Argonne National Lab., IL (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–298: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017420. Source: OSTI; NTIS; INIS; GPO Dep.

To test the effectiveness of damping techniques of the APS storage ring single-cell cavity, a beamline has been designed and assembled to use the ANL Chemistry Division linac beam (20-MeV, FWHM of 20 ps). A single-cell cavity will be excited by the electron beam to investigate the effect on higher-order modes (HOMs) with and without coaxial dampers (H-loop damper, E-probe damper), and wideband aperture dampers. In order for the beam to propagate on- and off-center of the cavity, the beamline consists of two sections – a beam collimating section and a cavity measurement section – separated by two double Aluminum foil windows. RF cavity measurements were made with coupling loops and E-probes. The results are compared with both the TBCI calculations and 'cold' measurements with the bead-perturbation method. The data acquisition system and beam diagnostics will be described in a separate paper.

33636 (ANL/PHY/CP–80101) **Experiments with polarized deuterium target at VEPP-3 storage ring: Status and perspective.** Frolov, V.V. (AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki); Mishnev, S.I.; Nikolenko, D.M. Argonne National Lab., IL (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930544–3: Conference on polarized ion sources and polarized gas targets, Madison, WI (United States), 23-27 May 1993). Order Number DE93017449. Source: OSTI; NTIS; INIS; GPO Dep.

A status of the internal polarized deuterium target experiment at VEPP-3 storage ring at 2 GeV electron energy is presented. A value of T_{20} at q = 3.7fm $^{-1}$ was obtained by suing an active storage cell in conjunction with an atomic beam source. Substantial progress is expected by introducing the high-density laser-driven target.

33637 (BNL–49166) **Simulation of emittance dilution in electron storage ring from Compton backscattering.** Blumberg, L.N.; Blum, E. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–302: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017611. Source: OSTI; NTIS; INIS; GPO Dep.

A Monte-Carlo simulation of Compton backscattered κ_L=3.2-μm photons from an IR-FEL on 75-MeV electrons in a storage ring

yields an RMS electron energy spread of Δ_E=11.9-keV for a sample of 10^7 single scattering events. Electrons are sampled from a beam of natural energy spread σ_E = 5.6-keV and damped transverse angle spreads σ_x', = .041-mrad and σ_y' = .052-mrad (100%) coupling, scaled from the 200-MeV BNL XLS compact storage ring. The Compton-scattered X-Rays are generated from an integral of the CM Klein-Nishina cross-section transformed to the lab. A tracking calculation has also been performed in 6-dimensional phase space. Initial electron coordinates are selected randomly from a Gaussian distribution of RMS spreads σ_{xo}=.102-mm, $\sigma_{x'o}$=.041-mrad, σ_{yo}=.018-mm, $\sigma_{y'o}$=.052-mrad, $\sigma_{\phi o}$=22-mrad and σ_{Eo}=6-keV. A sample of 10000 electrons were each following for 40000 turns around the ring through an RF cavity of f_{rf}=211.54-MHz and peak voltage V_m=300-keV. Preliminary results indicate that the resulting energy distribution is quite broad with an RMS width of Δ_E = 124-keV. The transverse widths are only slightly increased from their original values, i.e. Δ_x = .106-mm and $\Delta_{x'}$=.043 mrad. The scaled energy spread of $\Delta_E \sim$ 360-keV for $\sim$ 350,000 turns desired in a 10-msec X-Ray angiography exposure is well within the RF bucket used here; even V_m < 50-kV is adequate. Further, the electron energy spread adds a negligible RMS X-Ray energy spread of Δ_{Ex}=.32-keV. The electron energy damping time of τ_E=379-msec at 75-MeV in an XLS-type ring allows for damping this induced spread and top-off of the ring between heart cycles.

33638 (BNL–49167) **Plans to increase source brightness of NSLS x-ray ring.** Safranek, J.; Krinsky, S. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–301: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017612. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss plans to increase the NSLS X-Ray ring source brightness by an order of magnitude. Proposed improvements include doubling current from 250 mA to 500 mA, reducing vertical emittance by a factor of 6 and reducing insertion device gaps and periods by up to a factor of two. Experimental results are reported which indicate we have succeeded in reducing the vertical emittance below 2 Å.

33639 (FNAL/C–93/125) **Effects of transverse coupling on transverse beam size, simulation and measurements.** Halling, A.M. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–311: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017804. Source: OSTI; NTIS; INIS; GPO Dep.

The equations of motion for particles in an accelerator lattice show that a larger physical aperture is required to hold a beam of constant invariant emittance if there is transverse coupling of the tunes. The results of a tracking simulation of particle motion in the Fermilab accumulator ring are discussed, and results are shown from beam tests carried out in the accumulator to demonstrate this effect.

33640 (KEK-PR–92-1) **The tristan super light facility: Conceptual design report 1992.** National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1992. 223p. Order Number DE93520379. Source: OSTI; NTIS; INIS.

The Photon Factory and its user group have achieved excellent scientific results since its commissioning in 1982, ranging from material science to medical application, by using the synchrotron radiation at the 2.5 GeV PF storage ring, and since 1986, further at the 6.5 GeV Tristan accumulation ring which provides brilliant photons in high energy region. Efforts are exerted currently at National Laboratory for High Energy Physics for the extensive research and development works to study the feasibility of the Tristan e^+e^- collider main ring to be utilized as an extremely intense and highly advanced light source, which is called Tristan super light facility. What kinds of the application are expected for such highly brilliant source and their scientific significance should be clarified. This design report is an outcome by the joint work of in-house staffs and outside users, and it would serve as an excellent guide for the future studies on a next generation synchrotron radiation light source. The conversion plan of Tristan, the basic design of insertion devices, coherent X-ray sources, beam lines, instrumentation and others are reported. (K.I.).

33641 (KEK-PROC–92-4, pp. 6-8) **PLS vacuum chamber.** Choi, Woo-Chun (Pohang Inst. of Science and Technology, Kyuugnam (Korea, Republic of)); Park, Soo-Yong. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). May 1992. (CONF-9203224–: 8. meeting on ultra high vacuum techniques for accelerators and storage rings, Tsukuba (Japan), 12-13 Mar 1992). In *Proceedings of the 8th meeting on ultra high vacuum techniques for accelerators and storage rings.* 464p. Order Number DE93764168. Source: OSTI; NTIS; INIS.

The PLS vacuum chambers consist of 12 times of two sector chambers and one straight section. The chamber material is Al 5083-H321. Each chamber consists of a top and a bottom piece, which are machined separately and welded together. The pumping system to reduce the average operating pressure up to a nano Torr has three nine sets of lumped NEGs in tandem with ion pumps installed beneath photon stops, and six ion pumps per superperiod. Helicoflex seals are used to connect all vacuum components onto the vacuum chamber. A prototype chamber will be machined by February 1992. (author).

33642 (KEK-PROC–92-4, pp. 38-46) **The TRISTAN light source project.** Kamada, S. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). May 1992. (CONF-9203224–: 8. meeting on ultra high vacuum techniques for accelerators and storage rings, Tsukuba (Japan), 12-13 Mar 1992). In *Proceedings of the 8th meeting on ultra high vacuum techniques for accelerators and storage rings.* 464p. Order Number DE93764168. Source: OSTI; NTIS; INIS.

The TRISTAN main ring will be converted into a synchrotron light source of ultra high brilliance. The beam parameters of the TRISTAN light source are presented with the discussion on the merits of high energy accelerators as light sources. Also presented are the lattice layout and the optics which are to incorporate super long undulators and emittance damping wigglers (EDW). The super long undulator is a key to ultra high brightness and the EDW is an important tuning knob of e^+ (or e^-) beam. The related accelerator physics issues, such as dynamic aperture, intra-beam scattering, orbit errors and multi-bunch instabilities, are introduced. (author).

33643 (LBL–33220) **Survey and alignment data analysis for the ALS storage ring.** Keller, R. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–334: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018703. Source: OSTI; NTIS; INIS; GPO Dep.

The survey and alignment effort for the Advanced Light Source (ALS) accelerator complex has been described elsewhere. Data analysis for this task comprises the creation of ideal data, comparison of measured coordinates with ideal ones, and computation of alignment values, taking into account the effects caused by finite observation accuracy. A novel approach has been taken, using personal computer spreadsheets rather than more conventional programming methods. This approach was induced by the necessities to create and frequently refine the analysis procedures while measurements were already underway, and further by hardware constraints that limited the use of an available surveying code. A major benefit consists in the ability to identify and deal with discrepancies that occasionally arise when different techniques are used to observe the same object, in a timely and efficient manner. As a result of the performed survey and alignment work, the ALS lattice magnets have been positioned with accuracies well exceeding the original specifications.

33644 (LBL–33265) **Beam-beam effects for the PEP-II B Factory.** Furman, M.A. (Lawrence Berkeley Lab., CA (United States)); Eden, J.R. Lawrence Berkeley Lab., CA (United States); Washington Univ., Seattle, WA (United States). Dept. of Geophysics. May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–339: International particle accelerator conference, Washington, DC

(United States), 17-20 May 1993). Order Number DE93018701. Source: OSTI; NTIS; INIS; GPO Dep.

We present a summary of a fairly extensive study of beam-beam issues that arise in the design of PEP-II. Most of these studies are carried out with "strong-strong" multiparticle tracking simulations. We focus on: choice of nominal beam-beam parameter, strength of the parasitic collisions, injection issues, performance and tradeoffs with unequal beam-beam parameters. We comment only briefly on beam lifetime. We conclude that: the beams are sufficiently well separated so that the parasitic collisions are effectively weak; that small inequalities in the beam-beam parameters may imply more comfortable performance margins; and that vertical injection with vertical beam separation is more comfortable than horizontal.

33645 (PNL–8645) **Ultrawideband radar clutter measurements of forested terrain, 1991–1992.** Sheen, D.M.; Severtsen, R.H.; Prince, J.M.; Davis, K.C.; Collins, H.D. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 279p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017970. Source: OSTI; NTIS; GPO Dep.

The ultrawideband (UWB) radar clutter measurements project was conducted to provide radar clutter data for new ultrawideband radar systems which are currently under development. A particular goal of this project is to determine if conventional narrow band clutter data may be extrapolated to the UWB case. This report documents measurements conducted in 1991 and additional measurements conducted in 1992. The original project consisted of clutter measurements of forested terrain in the Olympic National Forest near Sequim, WA. The impulse radar system used a 30 kW peak impulse source with a 2 Gigasample/second digitizer to form a UHF (300–1000 MHz) ultrawideband impulse radar system. Additional measurements were conducted in parallel using a Systems Planning Corporation (SPC) step-chirp radar system. This system utilized pulse widths of 1330 nanoseconds over a bandwidth of 300–1000 MHz to obtain similar resolution to the impulse system. Due to the slow digitizer data throughput in the impulse radar system, data collection rates were significantly higher using the step-chirp system. Additional forest clutter measurements were undertaken in 1992 to increase the amount of data available, and especially to increase the amount of data from the impulse radar system.

33646 (ANL/IPNS/CP–79156) **Linearity and calibration of charge-division and rise-time encoded gas PSDs.** Crawford, R.K. (Argonne National Lab., IL (United States)); Thiyagarajan, P.; Chen, J. Argonne National Lab., IL (United States); Massachusetts Inst. of Tech., Cambridge, MA (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305177–11: 12. International collaboration of advanced neutron sources meeting (ICANS), Abingdon (United Kingdom), 24-28 May 1993). Order Number DE93017796. Source: OSTI; NTIS; GPO Dep.

Both linear and area gas proportional counter position-sensitive detectors (PSDs) are used at IPNS, and both charge-division and rise-time encoding schemes are used for these detectors. Impedance mismatching at the detector ends can lead to nonlinearities in the analog portion of the encoding circuits, and digitization errors can lead to local channel-to-channel variations in the position encoding. Some of these nonlinearities can be eliminated by appropriate circuit design, and a calibration scheme has been devised to effectively eliminate the remaining problems. Both circuit improvements and the calibration methods are discussed.

33647 (BHR–71) **Reactor physics models for neutron porosity gauges.** Oelgaard, P.L. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Afd. for Elektrofysik. May 1993. 16p. Order Number DE94600289. Source: OSTI; NTIS; INIS.

In this paper investigations of the development of theoretical models for neutron porosity gauges or tools, used in borehole logging, is reported. The first gauge considered consisted of a Ra-Be neutron source and a BF_3 thermal neutron detector. The second gauge consisted of a ^{241}Am-Be neutron source and a ^{6}Li containing glass scintillator which detects both thermal and epithermal neutrons. The third gauge was a double detector (^{3}He counters) neutron porosity tool used by a commercial logging company. It too is provided with a ^{241}Am-Be neutron source. In all cases the theoretical models developed were compared with experimental data and reasonable agreement was obtained. (au).

33648 (BNL–49016) **Fabrication of large area Si cylindric drift detectors.** Chen, W. (Brookhaven National Lab., Upton, NY (United States)); Kraner, H.W.; Li, Z.; Rehak, P.; Hess, F. Brookhaven National Lab., Upton, NY (United States). Apr 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-931107–1: Nuclear science symposium, San Francisco, CA (United States), 2-5 Nov 1993). Order Number DE93016132. Source: OSTI; NTIS; GPO Dep.

Advanced Si drift detector, a large area cylindrical drift detector (CDD), processing steps, with the exception of the ion implantation, were carried out in the BNL class 100 cleanroom. The double-side planer process technique was developed for the fabrication of CDD. Important improvements of the double-side planer process in this fabrication are the introduction of Al implantation protection mask and the remaining of a 1000 Angstroms oxide layer in the p-window during the implantation. Another important design of the CDD is the structure called "river," which ,allows the current generated on Si-SiO_2 interface to "flow" into the guard anode, and thus can minimize the leakage current at the signed anode. The test result showed that most of the signal anodes have the leakage current about 0.3 nA/cm^2 for the best detector.

33649 (BNL–49160) **Progress in the development of two-dimensional multiwire detectors for X-ray synchrotron radiation experiments.** Smith, G.C.; Yu, B.; Capel, M. Brookhaven National Lab., Upton, NY (United States). Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-931107–4: Nuclear science symposium, San Francisco, CA (United States), 2-5 Nov 1993). Order Number DE93017590. Source: OSTI; NTIS; INIS; GPO Dep.

A report is presented of the developments in two-dimensional, multiwire detectors for X-ray synchrotron radiation experiments, using delay line position readout. Advances have been made in methods of cathode design and fabrication, a description is given of the trade-off between position resolution and count rate capability, and the importance of low dead-time TDCs is illustrated. A detector has been operating successfully for well over a year at the time resolved, scattering station of the National Synchrotron Light Source; results are presented from this which illustrate the very good resolution (100 μm FWHM), differential non-linearity ($\pm$4%) and absolute position stability of these devices, and the importance of low differential non-linearity for these types of experiment.

33650 (CONF-9209263–14) **Fast sampling calorimetry with solid argon ionization chambers.** Clark, E. (Florida State Univ., Tallahassee, FL (United States)); Linn, S.; Piekarz, H.; Wahl, H.; Womersley, J.; Hansen, S.; Hurh, P.; Rivetta, C.; Sanders, R.; Schmitt, R.; Stanek, R.; Stefanik, A. Florida State Univ., Tallahassee, FL (United States); Fermi National Accelerator Lab., Batavia, IL (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40319. From 3. international conference on calorimetry in high energy physics; Corpus Christi, TX (United States); 29 Sep - 2 oct 1992. Order Number DE93018268. Source: OSTI; NTIS; INIS; GPO Dep.

A proposal for the fast sampling calorimetry with solid argon as active medium and the preliminary results from the solid argon test cell are presented. The proposed test calorimeter module structure, the signal routing and the mechanical and cryogenic arrangements are also discussed.

33651 (DOE/ER/40162–T6) **[Heavy ion nuclear physics research]: Progress report, 1991–1992.** Liu, X.T.; Petitt, G.A.; Zhang, Ziyang. Georgia State Univ., Atlanta, GA (United States). Dept. of Physics and Astronomy. [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-84ER40162. Order Number DE93018862. Source: OSTI; NTIS; INIS; GPO Dep.

We have continued working on essentially the same projects during the period 1991–92 as reported on in our previous progress report. That is, R&D work on a dimuon detector for RHIC and work with the group at LANL on neutron induced fission measurements using the white neutron source at LAMPF. Our work has included participation in the RD-10 experiment at the AGS to study calorimeter/absorber optimization for a RHIC experiment. We have actively participated in the setup of the apparatus, the data-taking and the subsequent data analysis. We have used the Vax computer system in our department and the eight-processor Silicon Graphics system in the GSU computer center for most of the data analysis work. We have also continued our work on Monte Carlo simulations of various configurations of absorber/calorimeters for detection of electrons and muons in RHIC experiments. We have made increasing use of the Silicon Graphics computer for our work. Each processor has approximately the same power as a Decstation 5000 and we usually have essentially exclusive simultaneous use of three of the processors. We have installed GEANT 315 and PAW on this system. Since our Vaxstation was purchased before DECWINDOWS was a standard part of the Vax software we have been unable to use the Silicon Graphics computer for doing graphics with PAW and GEANT. We are attempting to solve this problem by installing X-Windows software on our 386SX system which is connected to the campus network. Our work at Los Alamos has consisted of participation in the LAMPF run during the summer of 1991 including constructing and setting up two new neutron detectors for the experiment. These projects are discussed in further detail in this paper.

33652 (DOE/ER/40678–T1) **The RDT-RPC technology option of GEM.** Michigan State Univ., East Lansing, MI (United States). 29 Jan 1993. 175p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40678. Order Number DE93019853. Source: OSTI; NTIS; GPO Dep.

A muon system for the GEM SSCL detector based on Round Drift Tubes (RDT) has many attractive features. The Pt-trigger and beam crossing tag for the RDT tracking system can be accomplishment by either a PWC system, similar but less costly in design than Cathode Strip Chambers, or by a promising new type of RPC chamber. Given the economic construction of these chamber technologies a system can be envisioned with both good momentum reconstruction performance and pattern recognition capabilities. Full-scale chamber prototypes based on the RDT and RPC technologies have been constructed and tested successfully at the Texas Test Rig. Spatial resolutions have been measured in two designs of RDT chambers which meet or exceed the baseline resolution requirement of 100μm per chamber layer.

33653 (DOE/FTR–93014640) **Participation in meetings on two high energy physics experiments: The L3 experiment currently taking data at CERN's LEP collider and the GEM detector being designed for the superconducting supercollider.: Foreign trip report, February 20–May 10, 1992.** Wenaus, T.J. Lawrence Livermore National Lab., CA (United States). 2 Jun 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014640. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report covers a two week period at LLNL, a GEM Collaboration meeting in Tucson, a two month period at the L3 experiment at CERN, Geneva, Switzerland, and participation in a data acquisition workshop in Viareggio, Italy. Activities covered by this trip arose from our collaboration on two high energy physics experiments, the L3 experiment currently taking data at CERN's LEP collider and the GEM detector being designed for the Superconducting Supercollider: Primary activities at CERN were continuation of work on L3 b physics analysis, activities related to L3 datataking, and maintenance of L3 simulation production on the large parallel computer of Livermore's Massively Parallel Computing Initiative (MPCI) project.

33654 (DOE/FTR–93014814) **Travel to Italy for discussions about Si Strip Detectors and a presentation at the VI European Symposium on Semiconductor Detectors: Foreign trip report, February 21–27, 1992.** Laakso, M. Fermi National Accelerator Lab., Batavia, IL (United States). 5 Mar 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93014814. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The main purpose of the trip was to present the paper 'Operation and Radiation Resistance of a FOXFET Biasing Structure for Si Strip Detectors' at the symposium. The biannual European Symposium on semiconductor detectors is the only specialized meeting on the subject of semiconductor detectors and related electronics in the world presently, and collects together the very best experts in the field. This year new developments were reported especially on the integration of readout electronics on the same silicon wafer with the detector components. Also developments in double-sided silicon strip detectors and associated electronics were extensively reported. Review talks were presented in closely related fields like gallium arsenide based infrared detectors, radiation damage mechanisms in Si detectors and thermal microcalorimetry. In technical discussions at INFN Padova radiation damage mechanisms in silicon strip detector biasing structures were talked about.

33655 (ETDE-IT–93-196) **Western European calibration cooperation (WECC) and its technical activitty in field of ionizing radiation.** Rotondi, E. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). 1993. 4p. (CONF-9304196–1: Austrian-Italian-Hungarian radiation protection symposium, Obergurgl (Austria), 28-30 Apr 1993). Order Number DE93522930. Source: OSTI; NTIS (US Sales Only).

International trade, the exchange of scientific information, as well as, a multitude of pure and applied scientific and technological projects carried out on an international basis, are all highly dependent upon the validity of the measurement results. To this end, a fundamental contribution is obtained by using instruments calibrated with measurements whose values and uncertainties have been assigned with reference to national and international measurements standards. In order to fulfill the increasing need for accurate measurements, in many countries a national calibration system is already in place or is being established. The system is generally constituted by primary metrological institutes and by a network of calibration laboratories accredited by each national accreditation body as traceable to primary institutes in a specific field of measurements. Laboratory accreditation occurs in accordance with well established criteria. In Western Europe these criteria are laid down in the EN 45001 standard. Internationally, laboratories have to meet the criteria of ISO/IEC Guide 25. The experience, gained in many years of accreditation activity, has confirmed that the technical competence of a laboratory is effectively proved by proficiency tests. At an international level, interlaboratory comparisons are recognized as the most important means for building up and maintaining mutual confidence among calibration laboratories in different countries and among national accreditation bodies.

33656 (IHEP-OTF–91-176) **Simulation of the forward calorimeter for LHC detector.** Zmushko, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. 25p. Order Number DE94600285. Source: OSTI; NTIS (US Sales Only); INIS.

Future collider experiments would need high-precision measurement of the missing transverse momentum and forward jets tagging. These tasks may be solved with help of the forward calorimeter. Simulation of the forward calorimeters for LHC detector so as to determine the requirements for its parameters, was made. It is shown that the calorimeter having a granularity up to 0.5x0.5, the energy resolution of 20% and 100% allows us to measure the missing transverse momentum with good precision and to determine the transverse momentum and the energy of jets with the accuracy of 10-20%. The influence of the hadronic shower size on the results of the simulation is estimated. 8 refs.; 16 figs.; 5 tabs.

33657 (INIS-RU–347, pp. 296) **Detection of light charged particles by scintillation phosphich detector.** Fomichev, A.S.; Ortlepp, Kh.G.; Kherbakh, K.; David, I.; Vagner, V.; Zejnalov, V.S.

33677 (INIS-RU–353, pp. 43-47) **Angular fluctuations of Cherenkov radiation in gas due to dispersion.** Grishin, V.M.; Kotel'nikov, S.K. AN SSSR, Moscow (Russian Federation). Fizicheskij Inst. 1991. (In Russian). In *Short communications on physics. Experimental and theoretical physics. No. 9.* 48p. Order Number DE94600071. Source: OSTI; NTIS (US Sales Only); INIS.

The method for detection of the Cherenkov radiation (CR) rings used for identification of the relativistic charged particles (the so-called RICH detectors), was studied. The integral representation for the distribution $\phi_c(R)$ connected with dispersion, was obtained. The drift chambers filled with gas mixture with additions such as TMAE (tetramethylaminoethylen, $C_{10}H_{24}N$) and TEA(triethylamine, $C_6H_{15}N$), are usually used for measuring the CR ring radius R. The calculations were made for three spectral ranges: the visible one (300-600 nm), bialkaline cathode Sb-K-Cs; the ultraviolet one (165-220 nm), TMAE; and the vacuum ultraviolet one (145-165 nm), TEA. The dependence of the CR detection efficiency on energy of photons for different gases (Ar, CF_4, N) was also calculated.

33678 (LA-SUB–93-189) **A calorimeter for neutron flux measurement: Final report.** Chupp, T.E. (Harvard Univ., Cambridge, MA (US). Physics Labs.). Los Alamos National Lab., NM (United States); Harvard Univ., Cambridge, MA (United States). 1 Apr 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93019301. Source: OSTI; NTIS; INIS; GPO Dep.

A calorimeter for absolute neutron flux measurement has been built and tested. The calorimeter measures the heat produced in a 10°K thick LiPb target when neutrons are captured via the $^6Li(n,^3H)^4He$ reaction. The sensitivity achieved was $1.3x10^6$ n/s for a 1 hour measurement. Separate flux measurements with the calorimeter and a ^{238}U fission chamber are in agreement and show that systematic errors are less than 3%. An improved calorimeter has been built which is sensitive to 10^5 n/s for a 1 hour measurement.

33679 (LA-UR–91-3572) **A compact neutron detector for a geology application.** Biddle, R.S.; Collinsworth, P.R. Los Alamos National Lab., NM (United States). 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-911106–103: 1991 Institute of Electrical and Electronic Engineers (IEEE) nuclear science symposium and medical imaging conference, Santa Fe, NM (United States), 2-9 Nov 1991). Order Number DE93018564. Source: OSTI; NTIS; GPO Dep.

The authors recently designed and built a compact neutron detector for a geology experiment. The detector had to fit inside a 1.5-in.-diam borehole in a large block of concrete. They attached a gas-filled, 1-in.-diam ^3He tube to a 1-in.-diam electronics preamplifier package of their design. The electronics package consists of a cylindrically shaped, high-voltage section and a single-channel analyzer with a buffered output. The low-voltage components are mounted on a printed-circuit board. The circuit board and the high-voltage section are attached to a semicylindrical base. The outputs consist of a light-emitting diode for visual observations and a fixed-width, TTL-compatible pulse for a counter. This internal assembly is equipped with coaxial connectors and slips into a thin-walled tube that serves as the preamplifier housing. Power for a detector is supplied by an external, high-voltage supply and a 5-Vdc supply.

33680 (ORNL/FTR–3948) **Travel to Japan and China to address engineering issues related to the design of the barium fluoride calorimeter for the second detector at the Superconducting Super Collider Laboratory: Foreign trip report, May 24–June 2, 1991.** Moore, J.W.; Rennich, M.J.; Bauer, M.L. Oak Ridge National Lab., TN (United States). 24 Jun 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93016414. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Discussions with Hamamatsu Photonics resulted in several proposals for a specific design photoriode readout for the barium fluoride calorimeter. Additional discussions were undertaken to inform Hamamatsu of the requirements for the Liquid Scintillating Hadron calorimeter readout. This led to a proposal for a special design multichannel readout which will be prototyped. Meetings with representatives of the Chinese crystal manufacturing institutes resulted in a clear understanding of the production requirements and capabilities. Current production problems with the initial prototype crystals were discussed and proposed solutions were evaluated. Decisions were made to act on several of the proposals; a tentative agreement for production of the final crystals was received.

33681 (ORNL/FTR–4632) **Travel to England to participate in the EUROGAM collaboration meeting held on the campus of the University of Liverpool: Foreign trip report, May 14–20, 1993.** Baktash, C. Oak Ridge National Lab., TN (United States). 23 Jul 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019175. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler presented an invited talk at the EUROGAM collaboration meeting which discussed the experimental results for two experiments, with the ORNL staff as the spokesmen. The meeting provided an excellent forum to hear and discuss the results from all experiments completed during the first phase of operation of EUROGAM at the Daresbury Laboratory. The traveler also explored the feasibility of moving the Daresbury recoil separator to ORNL to be used for the planned astrophysics experiments with radioactive ion beams.

33682 (ORNL/TM–12102) **Angular response characterization of the Martin Marietta Energy Systems, Inc., personnel dosimeter.** Ahmed, A.B.; McMahan, K.L.; Colwell, D.S. Oak Ridge National Lab., TN (United States). Aug 1993. 33p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019735. Source: OSTI; NTIS; INIS; GPO Dep.

An evaluation of the Martin Marietta Energy Systems, Inc., personnel dosimeter to radiation incident from non-perpendicular angles was carried out to meet the Department of Energy Laboratory Accreditation Program (DOELAP) requirements. Dosimeters were exposed to six different radiation sources. For each source, dosimeters were rotated about their horizontal and vertical axes at seven different angles each. Raw readings were processed through the dose calculation algorithm used for routine personnel dosimetry to determine dose equivalent values. Dose equivalent responses relative to zero degree incident angle were found to be within ± 20% for M150, K-59 and ^{137}Cs photons when the incident angle was 60° or less. For low-energy photon irradiations (M30 and K-16), responses for angles other than perpendicular incidence are generally unpredictable. Reasons include: (1) failure of dose calculation algorithm to identify the radiation field correctly due to unusual element ratios; and (2) at extreme angles (± 85°), the dosimeter design (in relation to the irradiation geometry) becomes the limiting factor in producing reproducible results. Response to ^{204}Tl beta particles decreases rapidly with increasing angle of incidence.

33683 (ORNL/TM–12300) **Design of an advanced TLD-based fixed nuclear accident dosimeter.** Casson, W.H.; Mei, G.T. Oak Ridge National Lab., TN (United States). Aug 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019856. Source: OSTI; NTIS; INIS; GPO Dep.

A new system has been designed for use as a fixed nuclear accident dosimeter based upon the thermoluminescent dosimeter (TLD) system used for personnel dosimetry at US Department of Energy facilities managed by Martin Marietta Energy Systems, Inc. The system is made up of a small phantom consisting of two main parts measuring 20 x 20 x 5 cm and made from polymethylmethacrylate. A neutron-sensitive TLD card is placed in the center between the two pieces. Also, TLD cards in standard holders are mounted on the front and back of the phantom. A derivation is made of a linear combination of the responses from the TLD elements which results in calculation of the neutron fluence, absorbed dose, and dose equivalent. By using the right linear combinations, a crude spectrum can be estimated, which allows further calculation of the average fluence-to-dose-equivalent conversion factor. The response of the system was tested and found to be applicable for the evaluation of typical nuclear accident spectra, although considerable improvement can be made by the addition of a sulfur pellet. The system was also tested for angular dependence. In order to move the development of this system from the proof-of-principle to full application, the calculation of the TLD resonse curves must be improved, additional measurements must be made, and the system must be tested in a simulated accident neutron field. The advantages of the new fixed dosimeter system are its simplicity, easy maintenance, and lower operational cost. The system uses standard TLD cards that are already in place throughout Energy Systems facilities. The TLD process personnel are famliiar with evaluating doses from TLDs and can provide information necessary to ensure timely and accurate assessment of exposures that may result from riticality accidents. Most of the quality control requirements are part of the existing personnel dosimetry system.

33684 (PNL-SA–22024) **A low power Multi-Channel Analyzer.** Anderson, G.A.; Brackenbush, L.W. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930640–4: 8. IEEE conference on real-time computer applications in nuclear, particle and plasma physics, Vancouver (Canada), 8-11 Jun 1993). Order Number DE93017664. Source: OSTI; NTIS; INIS; GPO Dep.

The instrumentation used in nuclear spectroscopy is generally large, is not portable, and requires a lot of power. Key components of these counting systems are the computer and the Multi-Channel Analyzer (MCA). To assist in performing measurements requiring portable systems, a small, very low power MCA has been developed at Pacific Northwest Laboratory (PNL). This MCA is interfaced with a Hewlett Packard palm top computer for portable applications. The MCA can also be connected to an IBM/PC for data storage and analysis. In addition, a real-time time display mode allows the user to view the spectra as they are collected.

33685 (TRI-PP–90-72) **Some results on the use of avalanche photodiodes for scintillating fiber readout.** Salomon, M.; Kitching, J. TRIUMF, Vancouver, BC (Canada). Sep 1990. 4p. (CONF-9009123–: 13. international conference on plasma physics and controlled nuclear fusion research; 1990 Linear accelerator conference; Symposium on detector research and development for the Superconducting Super Collider, Washington, DC (United State Order Number DE94600286. Source: OSTI; NTIS (US Sales Only); INIS.

We have measured the properties of avalanche photodiodes (APDs) for possible use in conjunction with scintillating fibers as charged particle detectors. The quantities measured so far have been the gain of the APDs, the amplitude distribution of pulses from particles through the fibers, and the efficiency of detecting these particles. The preliminary results indicate the importance of the choice of associated electronics and good optical coupling between fiber and APD. The results obtained so far have been measured at room temperature and -100 C. (Author) (13 refs., 4 figs.).

33686 (UCRL-JC–113721) **HEGRS: Mechanical design of a high-energy, gamma-ray spectrometer.** Pedersen, K.B. Lawrence Livermore National Lab., CA (United States). 4 Jun 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9310123–1: 14. biennial Pan American Congress of Mechanical and Electrical Engineers, San Juan (Puerto Rico), 3-8 Oct 1993). Order Number DE93017192. Source: OSTI; NTIS; GPO Dep.

A large, 3200-kg (7000-lb) gamma-ray spectrometer was designed to move in a 1500 arc with an arc accuracy of 0.50, and to move radially over a distance of 650 mm (25 in.). The entire structure is aluminum rather than steel because of the high neutron background. The two-layer support accommodates rapid, accurate positioning of the spectrometer in both the rotational and radial directions within 0.1 mm (0.004 in.). All movements and positioning are computer-controlled. The centerline deviation over the entire surface is 0.25 mm (0.0100 in.). The bottom layer, called the table, permits arc motion. The table is a baseplate consisting of two 3.6-m x 1.2-m (12-ft x 4-ft) cast-aluminum jig plates. The top layer, called the sled, is an aluminum plate 2.12-m x 1.22-m (83.38-in. x 48-in.) wide, which provides for radial motion. Due to the large mass of the spectrometer and the accurate positioning required, air pads are used to facilitate movement. Hydraulic brakes are applied when the detector is in its rest position to comply with the seismic requirements of the installation.

33687 (UCRL-JC–113960) **The liquid helium thermosyphon for the GEM detector magnet.** Warren, R.P. Lawrence Livermore National Lab., CA (United States). 4 May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930537–92: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93018638. Source: OSTI; NTIS; GPO Dep.

The GEM detector magnet, a horizontal solenoid 19.5 m in diameter and wound with a niobium-titanium cable in conduit, will be located with it's axis 19.5 m below grade. The conductor is wound on the inside of an aluminum bobbin which is cooled by liquid helium which flows by natural convection in a thermosyphon loop from a large storage dewar located at the ground surface. The function of the thermosyphon system is to absorb the environmental heat load as well as any internally generated heat. In the first category is included that heat which is transfered to the magnet by way of the mechanical supports, the insulation and the current leads. The internally generated heat includes the resistive heating within the normally conducting conductor splices and the inductive heating of the bobbin during current transients. Though similar systems have been employed elsewhere, there are some unique aspects to the present design. By taking advantage of the large vertical head available, the parallel heat exchanger passes within the magnet remain sub-cooled, thus insuring single phase coolant

within the magnet. It is believed that this will be the first instance of such a large vertical head being used to this advantage in a helium system.

33688 (UCRL-JC–114014) **Precision machining and polishing of scintillating crystals for large calorimeters and hodoscopes.** Wuest, C.R.; Fuchs, B.A. Lawrence Livermore National Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930537–94: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93018663. Source: OSTI; NTIS; INIS; GPO Dep.

New machining and polishing techniques have been developed for large barium fluoride scintillating crystals that provide crystalline surfaces without sub-surface damage or deformation as verified by Atomic Force Microscopy (AFM) and Rutherford Back-scattering (RBS) analyses. Surface roughness of about 10–20 angstroms and sub-micron mechanical tolerances have been demonstrated on large crystal samples. Mass production techniques have also been developed for machining and polishing up to five 50 cm long crystals at one time. We present this technology along with surface studies of barium fluoride crystals polished with this technique. This technology is applicable for a number of new crystal detectors proposed at Colliders including the Barium Fluoride Electromagnetic Calorimeter at SSC, the Crystal Clear Collaboration's cerium fluoride calorimeter at LHC, and the KTeV and PHENIX scintillating hodoscopes at Fermilab, and RHIC, respectively. Lawrence Livermore National Laboratory (LLNL) has an active program of study on barium fluoride scintillating crystals for the Barium Fluoride Electromagnetic Calorimeter Collaboration and cerium fluoride and lead fluoride for the Crystal Clear Collaboration. This program has resulted in a number of significant improvements in the mechanical processing, polishing and coating of fluoride crystals. Techniques have been developed using diamond-loaded pitch lapping that can produce 15 angstrom RMS surface finishes over large areas. Also, special polishing fixtures have been designed based on mounting technology developed for the 1.1 m diameter optics used in LLNL's Nova Laser. These fixtures allow as many as five 25–50 cm long crystals to be polished and lapped at the same time with tolerances satisfying the stringent requirements of crystal calorimeters. We also discuss results on coating barium fluoride with UV reflective layers of magnesium fluoride and aluminum.

33689 (UCRL-JC–114015) **High rate resistive plate chambers: An inexpensive, fast, large area detector of energetic charged particles for accelerator and non-accelerator applications.** Wuest, C.R.; Ables, E.; Bionta, R.M.; Clamp, O.; Haro, M.; Mauger, G.J.; Miller, K.; Olson, H.; Ramsey, P. Lawrence Livermore National Lab., CA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930537–96: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93018664. Source: OSTI; NTIS; INIS; GPO Dep.

Resistive Plate Chambers, or RPCs, have been used until recently as large detectors of cosmic ray muons. They are now finding use as fast large-area trigger and muon detection systems for different high energy physics detectors such the L3 Detector at LEP and future detectors to be built at the Superconducting Super Collider (SSC) and at the Large Hadron Collider (LHC) at CERN. RPC systems at these accelerators must operate with high efficiency, providing nanosecond timing resolution in particle fluences up to a few tens of kHz/cm^2 – with thousands of square meters of active area. RPCs are simple and cheap to construct. The authors report here recent work on RPCs using new materials that exhibit a combination of desirable RPC features such as low bulk resistivity, high dielectric strength, low mass, and low cost. These new materials were originally developed for use in electronics assembly areas and other applications, where static electric charge buildup can damage sensitive electrical systems.

Measurements of deep level spectrum of high resistivity silicon detectors irradiated by high fluence fast neutrons (Φ_n: 2 x 10^{12}n/cm^2) have been made using a thermally stimulated current (TSC) spectrometer. It has been found that at least nine new defect levels, with peaking temperature of 19K, 27K, 36K, 44K, 49K, 83K, 93K, 105K, and 120K, begin to appear when $\Phi_n \geq 1 \times 10^{13}$n/cm. All peaks have strong dependences on the filling voltage (V_{fill}, forward bias) or injection current especially for high fluence ($\Phi_n \geq 10^{13}$ n/cm^2) situations. The defect concentration, energy level in the band gap, and cross section of each deep level, totaling, at least 13, have been studied systematically and possible identifications of the levels have been discussed.

33692 (BNL–48563) **Temperature effects and corrections in volume measurements based on liquid-level detection.** Suda, S.; Keisch, B. Brookhaven National Lab., Upton, NY (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930749–53: 34. annual meeting of the Institute of Nuclear Materials Management, Scottsdale, AZ (United States), 18-21 Jul 1993). Order Number DE93019044. Source: OSTI; NTIS; GPO Dep.

Temperature changes affect volume measurements in several ways. The dimensions of the tank, and the density and level of the liquid it contains vary with temperature. In addition, the response signal of the sensor and hence the response of the liquid-level detection device may change with temperature. Level measurement devices can be grouped according to four measurement points of reference: tip of probe, response proportional to the length of probe, top of tank, and liquid surface. This paper describes the physical principles of pressure, capacitance probe, sonic reflections, and visual scales. These are representative of the four types of liquid level detection techniques. Development of the temperature correction algorithm requires that the measurement process be clearly defined, conditions or limitations specified, and that a temperature-effects test be run. Although not difficult or necessarily time-consuming to run, good practice requires a test plan following demonstrated guidelines. Measurement control procedures for re-measurement of the process solution in the tank during normal

operation can provide data to validate temperature correction algorithms.

A versatile new camera, the Los Alamos National Laboratory (LANL) model GY6, is described. It operates at a wide variety of frame rates, from RS-170 to 700 frames per second. The camera operates as an NTSC compatible black and white camera when operating at RS-170 rates. When used for variable high-frame rates, a simple substitution is made of the RS-170 sync/clock generator circuit card with a high speed emitter-coupled logic (ECL) circuit card.

33694 (LBL–34091) **Chemical dynamics in time and energy space.** Myers, J.D. Lawrence Berkeley Lab., CA (United States). Apr 1993. 233p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93018595. Source: OSTI; NTIS; GPO Dep.

The development of a versatile picosecond ultraviolet/vacuum ultraviolet temporal spectrometer and its potential use for measuring internal energy redistribution in isolated molecules are described in detail. A detailed description of the double-pass Nd:YAG amplifier and the dye amplifiers is given with the pulse energies achieved in the visible, ultraviolet, and vacuum ultraviolet. The amplified visible pulses are shown to be of sub-picosecond duration and near transform limited. The instrument's temporal response ($\leq$10 ps) is derived from an instrument limited measurement of the dissociation lifetime of methyl iodide at 266 nm. The methyl iodide experiment is used to discuss the various sources of noise and background signals that are intrinsic to this type of experiment. Non-time-resolved experiments measuring the branching ratio and kinetic energy distributions of products from the 193 nm photodissociation of cyclopentadiene and thiophene are presented. These studies were done using the molecular beam Photofragment Translational Spectroscopy (PTS) technique. The results from the cyclopentadiene experiment confirm that H atom elimination to yield the cyclopentadienyl radical is the dominant dissociation channel. A barrier of $\geq$5 kcal/mol can be understood in terms of the delocalization of the radical electron of the cyclopentadienyl fragment. A concerted elimination yielding cyclopropene and acetylene was also observed and is proposed to occur via a bicyclo-[2.1.0]pent-2-ene intermediate. Two other channels, yielding acetylene plus the CH_2CHCH triplet carbene, and CH_2 plus 1-buten-3-yne, are postulated to occur via ring opening. The implications of the experimental results for bulk thermal oxidation and pyrolysis models are discussed. The thiophene experiment shows six competing dissociation channels. The postulated intermediates for the various thiophene dissociation channels include bicyclo, ring opened, and possibly ring contracted forms.

33695 (SAND–93-0644) **Image blur.** Nissen, M.R. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93017944. Source: OSTI; NTIS; GPO Dep.

The image blur in a photograph is produced by the exposure of a moving object. Knowing the amount of image blur is important for recording useful data. If there is too much blur, it becomes hard to make quantitative measurements. This report discusses image blur, the parameters used to control it, and how to calculate it.

33696 (UCRL-ID–113713) **Radiation induced darkening of the optical elements in the Startracker camera.** White, R.H.; Wirtenson, G.R. Lawrence Livermore National Lab., CA (United States). Mar 1993. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018907. Source: OSTI; NTIS; INIS; GPO Dep.

Optical glass flats that closely simulate the elements used in the Startracker lens designs were exposed to doses of ionizing radiation ranging from 0.44 to 1300 krad. Photometer traces determined the transmittance of the samples as a function of both wavelength and dose for wavelengths in the range 300 to 1200 nm. Cerium stabilized glasses used in the radiation stabilized Startracker system showed only a small amount of darkening for doses up to and exceeding 1 Mrad. Glasses used in the unstabilized Startracker design showed significant darkening to visible and ultra-violet spectra for doses as low as 5 krad. Plots of transmittance versus wavelength for various doses are given for each of the Startracker optical elements. Radiation induced absorption parameters that determine the radiation induced absorption coefficient are tabulated and plotted versus wavelength.

33697 (WHC-SD-EN-TP–030) **Integrated test plan for the demonstration of a commercial Fourier Transform Infrared instrument.** Koegler, K.J. Westinghouse Hanford Co., Richland, WA (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93018518. Source: OSTI; NTIS; GPO Dep.

This integrated test plan describes the use of a commercial Fourier Transform Infrared instrument for measuring Carbon Tetrachloride concentrations. The Fourier Transform Infrared will measure CCL4 concentrations in a line of sight path average mode in mass per cubic meter as a function of time. The goal of this test is to demonstrate the usefulness of a long path Fourier Transform Infrared instrument in determining CCL4 fluxes from the soil in the 200 area adjacent to disposal cribs where high soil fluxes are believed to exist. The instrument will be set up such that it can have a clear line of site path to it's reflector and this line of site will be as near to the Z-9 fence as possible and have a path length as long as possible.

33698 (UCRL-ID–113953-Rev.1) **Comments on computational underwater acoustics: Revision 1.** Hedstrom, G. Lawrence Livermore National Lab., CA (United States). Jul 1993. 13p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019880. Source: OSTI; NTIS; GPO Dep.

The authors discuss some of the considerations to take into account regarding the choice of methods for computational acoustics. They examine finite differences and finite elements, normal modes, and paraxial (parabolic) approximations. For each of these methods there is a class of problems for which it is well suited. Thus, finite differences and finite elements are best for short-range computations, normal modes are restricted to nearly-stratified media, and paraxial approximations work well when the signal is confined to the underwater sound channel. The authors discuss the reasons behind this state of affairs. They also point out some characteristics of these methods which are important for the numerical applications. It is concluded that the method of normal modes is numerically the most efficient computational method for underwater acoustics when it is a valid approximation. That is, one should use normal modes when the medium is nearly horizontally stratified. Paraxial approximations are very attractive for propagation in an underwater sound channel. They may be modified to incorporate interaction with a solid bottom if the wave speeds in the bottom are close to the speed of sound in water. Thus, an uncompacted solid bottom is not a great difficult for paraxial approximations. The numerical methods which are most flexible with respect to wide ranges of material properties use finite differences or finite elements, but such methods are only feasible for computation over short distances.

33699 (CONF-930755–3) **Atomic resolution electron energy loss spectroscopy in the scanning transmission electron microscope.** Browning, N.D.; Chisholm, M.F.; Pennycook, S.J. Oak Ridge National Lab., TN (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. analytical electron microcopy (AEM) workshop; Los Angeles, CA (United States); 11-16 Jul 1993. Order Number DE93015334. Source: OSTI; NTIS; GPO Dep.

Electron energy loss spectroscopy (EELS) in the scanning transmission electron microscope (STEM) is an invaluable tool for the microanalysis of materials, providing information on both compositional and electronic structure fluctuations on the sub-nanometre scale. To utilise fully the high resolution potential of the energy loss signal, it is essential to have a reference high-resolution image showing the atomic structure in the region of study. The recently developed high-resolution Z-contrast imaging technique for the STEM, provides an intuitive reference image of the atomic structure that, as both imaging and microanalysis can be performed simultaneously, can be conveniently used to position the electron probe over individual atomic columns. The spatial resolution of both the image and the energy loss spectrum can be identical, and in principle limited only by the probe size of the microscope. Therefore, for the 2.2Å probe size of the VG HB501 UX dedicated STEM, there exists the ability to be able to resolve individual atomic columns or planes.

33700 (DOE/EW/50616–T13) **Earth Penetration Radar Imaging System (EPRIS): Final report.** Coleman Research Corp., Orlando, FL (United States). Aug 1993. 83p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AI01-92EW50616. Contract DAAA21-90-D-0007. Order Number DE93019890. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Earth Penetration Radar Imaging System (EPRIS) has been developed and has the capability to detect and locate buried mines, buried ordnance delivered by precision munitions, buried drums, buried waste/contaminants, and geological structures/features. The detected objects or features are mapped in three dimensions with high resolution. This information is then available for integration into a site characterization study. The EPRIS is a significant improvement in non-intrusive sensing and imaging capability. This phase of the EPRIS development has been extremely successful. Coleman Research Corporation (CRC) has implemented significant advances in technology into the EPRIS equipment. The frequency stepped radar sensor design has a very wide dynamic signal range and improved sensitivity over currently available equipment. The two- and three-dimensional image processing algorithms allow high-resolution placement and sizing of buried objects and/or features. The discussions related to the analog-to-digital converter and the spiral antenna, define the source of the dynamic range capability realized by EPRIS. The processing for this new radar makes use of unique synthetic aperature imaging (SAI) algorithms developed by CRC for frequency stepped radar systems. The SAI algorithms are necessary to obtain excellent spatial resolution on objects buried up to seven meters. The sensor signal processing represents a significant improvement in imaging systems. The CRC test facility permitted tests on objects buried up to 2.44 meters.

33701 (SAND–92-2844) **Development of a quartz digital accelerometer for environmental sensing and navigation applications.** Kass, W.J.; Vianco, P.T. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018503. Source: OSTI; NTIS; INIS; GPO Dep.

A quartz digital accelerometer has been developed which uses double ended tuning forks as the active sensing elements. The authors have demonstrated the ability of this accelerometer to be capable of acceleration measurements between ±150G with ±0.5G accuracy. They have further refined the original design and assembly processes to produce accelerometers with < 1mG stability in inertial measurement applications. This report covers the development, design, processing, assembly, and testing of these devices.

33702 (SAND–93-0882C) **Experiments and analysis of lateral piezoresistance gauges.** Wong, M.K.W. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930676–13: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93017874. Source: OSTI; NTIS; GPO Dep.

The response of lateral piezoresistance gauges to shock wave uniaxial strain loading has been examined in a combined experimental and calculational effort. Plate impact experiments provided lateral gauge data which were analyzed using quasi-static and dynamic inclusion analyses. Experimental data showed that the response of the lateral gauge output depended upon the matrix material and gauge emplacement method. The calculations indicated that these differences were due to complex gauge-matrix interactions. These interactions were influenced by the stress and strain distributions in and around the gauge, plasticity effects, properties of the gauge and matrix materials, and emplacement conditions.

33703 (SAND–93-1232) **Calibration of accelerometers at the Dropball Station.** Rebarchik, F.N. Sandia National Labs., Albuquerque, NM (United States). Aug 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93019309. Source: OSTI; NTIS; GPO Dep.

This memorandum is a synopsis of the description and operation of the equipment used and the events occurring during the calibration of various accelerometers at the Dropball Station.

33704 (DOE/FTR–93013405) **[Travel to Aldermaston, UK for the SUBWOG 6P meeting and to Noordwijk, Netherlands and Abingdon, England to visit the European Space Research and Technology Center and AEA Industrial Technology, Culham Laboratory]: Foreign trip report, May 29–June 10, 1992.** McGlaun, J.M.; Chhabildas, L.C.; Asay, J.R. Sandia National Labs., Albuquerque, NM (United States). 23 Jul 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013405. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of the trip was to participate in a Technical Exchange Subcommittee meeting as a part of the SUBWOG-6P Joint US/UK Workshop, organized by the Atomic Weapons Establishment, Aldermaston, England. The SUBWOG-6P Meetings are the vehicle for the exchange of information between the United Kingdom and the United States on areas of mutual interest in Kinetic Energy Italy and Vulnerability. The meeting was organized by Dr. Nigel Fenner of the Atomic Weapons Establishment, and had participants at the meeting from Great Britain and the United States. Britain was represented by their staff from the Atomic Weapons Establishment at Aldermaston and Foulness. The United States had representatives from the Strategic Defense Initiative Office, US Army Strategic Defense Command, Defense Nuclear Agency, Lawrence Livermore National laboratory, Los Alamos National Laboratory, Sandia National Laboratory, Naval Surface Warfare Center, and Kaman Sciences. The development of hypervelocity launchers, weapon effects related to kinetic energy lethality, and the development of hydrodynamic codes and phenomenological KAPP codes for use to assess weapon effects and damage were among the topics discussed at this meeting.

33705 (DOE/FTR–93015301) **Travel to Germany for meeting on important future issues facing the NATO alliance: Foreign trip report, March 5–10, 1992.** Robinson, C.P. Sandia National

Labs., Albuquerque, NM (United States). 31 Mar 1992. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015301. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to participate in the Fifth Review on the Future Tasks of the Atlantic Alliance, a meeting led by Manfred Worner, Secretary General of NATO, held at Stiftung Wissenschaft und Politik (Institute for Science and Politics), Ebenhausen (nur Munich), Germany. Worner established these meetings to provide an off-the-record forum for "decision makers" within the Alliance to interact with invited policy, scientific, and think-tank leaders in an examination of the important issues facing the NATO Alliance in the future. The meeting focused on contingency planning for the further evolution of events within Europe: in particular, the likely further disintegration of the Commonwealth of Independent States (CIS), the economic and political future of the new Eastern Europe state, and the potential for other threats or crises for the Alliance from outside the European region. Predominant views were that the future evolution of the territories to the east of the NATO countries will be chaotic. The CIS was believed to be incapable of lasting beyond the end of the year and, because of political instability, we may very well be faced with the further breakup of the Russian Republic itself in the near future.

33706 (DOE/FTR–93015528) **Travel to France regarding research on photoconductive semiconductor switches, optoelectronics, and low impedance anode plasma source drivers: Foreign trip report, May 6–21, 1993.** Loubriel, G.M. Sandia National Labs., Albuquerque, NM (United States). 14 Jun 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015528. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The conference in Bordeaux was attended by US and French scientists. There was no European experimental work on impulse radar. Most of the work was theoretical, and concentrated on laser impulses and their interaction with matter. Some across section calculations for stealth bombers were presented. At Thomson-CSF I saw labs working on: optoelectronic signal processing for phased array antennas, laser diode arrays, and microwave communications. The U. of Braunschweig has an effort similar to ours: I toured their GaAs switch research facility and the impulse transmitter lab.

33707 (LA-SUB–93-246) **[Conceptual designs integrating electric guns on mobile platforms].** Los Alamos National Lab., NM (United States). 1993. 25p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93018284. Source: OSTI; NTIS (US Sales Only); GPO Dep.

During the period December 1988-March 1989, FMC conducted a design study for Los Alamos National Laboratory. The purpose of the study was to develop conceptual designs integrating electric guns on mobile platforms which represent weapon systems that meet mission requirements defined by BDM Corporation. BDM provided the mission area information based on guidance from the DARPA Electric Energy Gun System Study Panel. Mission areas for which FMC developed concepts were Fire Support and Anti-Armor. The Fire Support area was focused on the artillery role and Anti-Armor area was focused on the Main Battle Tank and Tank Destroyer roles. These concepts were also provided as support to BDM in their presentation at the Electrical Energy Gun System Study briefing at System Planning Corporation in Arlington, Virginia on February 1st, 1989. The top level presentation material (which includes information developed separately by BDM) has been classified Secret and is not provided in this report. The EEGSS classified final report is currently in review by DARPA prior to publication.

33708 (SAND–92-2397) **Equation of state and fragmentation issues in computational lethality analysis.** Trucano, T.G. Sandia National Labs., Albuquerque, NM (United States). Jul 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018680. Source: OSTI; NTIS; GPO Dep.

The purpose of this report is to summarize the status of computational analysis of hypervelocity impact lethality in relatively nontechnical terms from the perspective of the author. It is not intended to be a review of the technical literature on the problems of concern. The discussion is focused by concentrating on two phenomenology areas which are of particular concern in computational impact studies. First, the material's equation of state, specifically the treatment of expanded states of metals undergoing shock vaporization, is discussed. Second, the process of dynamic fragmentation is addressed. In both cases, the context of the discussion deals with inaccuracies and difficulties associated with numerical hypervelocity impact simulations. Laboratory experimental capabilities in hypervelocity impact for impact velocities greater than 10.0 km/s are becoming increasingly viable. This paper also gives recommendations for experimental thrusts which utilize these capabilities that will help to resolve the uncertainties in the numerical lethality studies that are pointed out in the present report.

33709 (SAND–93-0332C) **Perforation of HY-100 steel plates with long rod projectiles.** Hanchak, S.J. (Univ. of Dayton Research Inst., OH (US). Impact Physics Lab.); Altman, B.S.; Forrestal, M.J. Sandia National Labs., Albuquerque, NM (United States). 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9308133–1: Army symposium on solid mechanics, Plymouth, MA (United States), 17-19 Aug 1993). Order Number DE93017654. Source: OSTI; NTIS; GPO Dep.

The authors conducted perforation experiments with 4340 steel, rod projectiles and HY-100 steel, target plates at striking velocities between 80 and 370 m/s. Projectiles were machined to nominally 30-mm-diameter and 281-mm-length so they could be launched from a 30-mm-powder gun without sabots. The target plates were rigidly clamped at 305-mm diameter and had a nominal thickness of 10.2 mm. In addition to measuring striking and residual projectile velocities, they obtained back surface framing camera data that showed clearly the plate deformation and plug ejection process. An Imacon 792 camera provided up to 20 frames per experiment with an interframe time duration of 10 μs. The modeling work is in progress, but they present a beam model that exhibits the features observed in the experiments.

33710 (SAND–93-0389C) **Debris cloud characterization at impact velocities of 5 to 11 km/s.** Chhabildas, L.C.; Boslough, M.B.; Reinhart, W.D.; Hall, C.A. Sandia National Labs., Albuquerque, NM (United States). 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930676–28: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93018832. Source: OSTI; NTIS; GPO Dep.

A series of experiments has been performed on the Sandia HyperVelocity Launcher to impact a 1.25-mm thick aluminum bumper by an aluminum flier plate 17-mm diameter by 0.92-mm thick over the velocity range of 5 km/s to 11 km/s. Radiographic techniques were employed to record the debris cloud generated upon impact. The shape of the debris cloud is found to depend on the flier plate tilt. Generally – the data indicate a central core of higher density surrounded by a diffused layer. These experiments allow measurements of debris cloud expansion velocities as the material undergoes a phase change from solid fragments at impact velocities of 5 km/s to a mixture of liquid and vapor phase at higher impact velocities. The expansion velocity of the debris cloud increases with increasing impact velocity, with the high-density leading edge traveling faster than the impact velocity. There is a difference between the X-ray and photographic measurements of expansion velocities at higher impact velocities. This is believed to be due to the presence of very low-density vapor in the photographic records that are not detecting using X-ray techniques.

33711 (SAND–93-1674C) **A systems engineering/human factors approach to human machine interface design for aided target acquisition.** Kuperman, G.G. (Armstrong Lab., Wright-Patterson AFB, OH (United States)); Sobel, A.L. Sandia National Labs., Albuquerque, NM (United States). [1993]. 22p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9308134–1-Vugraphs: National fire control symposium, Boulder, CO (United States), 3-5 Aug

1993). Order Number DE93017502. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A systems/human engineering approach employing decision-assisting algorithms, ie, automatic target cuers and recognizers, (ATCs and ATRs) has been under development by the military service laboratories for well over a decade. Two major system applications have been addressed: target acquisition (for weapon delivery) and imagery interpretation (for reconnaissance exploitation). The objective of the target acquisition application has been cue preselected targets to a weapon systems operator. The expected benefits of this application have been to overcome the extreme time compression typical of air-to-ground attack against possibly defended fixed and mobile targets, to reduce crew workload, to simultaneously minimized missed targets and false alarms (i.e., nontargets incorrectly cued as targets), and to support single-pass attack tactics (avoiding repeated exposure of the attacking aircraft to terminal area threats). The reconnaissance support application, automated imagery exploitation, does not reflect either the extremely short timelines or severe survivability risks. Rather, this application is of interest because of the extremely large amounts of imagery that must be interpreted. Although reconnaissance missions are normally tasked against specific target (or potential target) locations, all coverage must eventually be reviewed by a human interpreter. Hence, the goal of automated image exploitation is to (relatively) rapidly review large amounts of imagery while minimizing the number of targets missed during the process. Similarly, the applications of interest encompass a variety of sensing phenomenologies: synthetic aperture radar (SAR), forward looking infrared (FLIR), laser detection and ranging (LADAR), etc. Each sensor class is capable of obtaining distinct target signature information and each is characterized by distinctive vulnerabilities to atmospheric and range-to-target conditions.

33712 (UCRL-ID–113763) **Alternatives to matched-field processing: An overview of the model-based approach.** Candy, J.V. (Lawrence Livermore National Lab., CA (US)); Sullivan, E.J. Lawrence Livermore National Lab., CA (United States). 26 Mar 1993. 21p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract N00014-91-F-0114. Order Number DE93017949. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The location of acoustical sources in a cluttered and noisy ocean environment is a difficult problem especially in light of the improved design of modern submarines. Therefore, it is necessary to incorporate more knowledge about the ocean environment into detection and localization algorithms in order to enhance the overall signal-to-noise ratios and improve performance. Recently, there have been many improvements to the signal processing of acoustical sources in the literature especially in the area of high resolution spatial processing (beamforming) for passive localization. Beamforming incorporates information on the "assumed" wavefront, here the the direction vector of an impinging plane wave source. As the ocean environment becomes more and more complicated, such as in our case, then the "plane wavefront" model fails, leading to severe beamformer performance degradation. In an effort to improve the performance of the beamformer for complex ocean environments – the matched-field processor has evolved as a potential solution. An alternative methodology to matched-field/matched-mode processing is the so-called model-based approach which is based on a state-space representation of the normal-mode propagation model. If state-space solutions can be accomplished, then many of the current ocean acoustic processing problems can be analyzed and solved offering a different and hopefully more revealing and intuitive framework to analyze results based on firm statistical and system theoretic grounds. In this application, the authors seek techniques to incorporate the (1) ocean acoustic propagation model; (2) sensor array measurement model; and (3) noise models (ambient, shipping, surface and measurement) into a processor to solve the associated signal enhancement/detection problems.

33713 (DOE/EA–0810) **Environmental Assessment for the ammunition storage facility at the Savannah River Site.** US-DOE Savannah River Field Office, Aiken SC (United States). Dec 1992. 6p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93016910. Source: OSTI; NTIS; GPO Dep.

The Savannah River Site (SRS), a DOE national defense facility. The SRS maintains an armed and uniformed protective force that performs patrol, guard, and monitoring activities on site. A safe, secure storage facility is needed for the storage of weapons, small arms ammunition, and explosives that may be used in carrying out such activities. This Environmental Assessment assesses the potential environmental and related safety impacts of constructing a small storage facility to replace the existing facility being used to store these munitions. Constructing a new storage facility is necessary to enable SRS to meet DOE requirements and any other applicable standards including DOE Order-6430.1A, General Design Criteria; - 5632.7, Protective Forces; - DOE Manuals-DOE/TIC 11268, Manual for Prediction of Blast and Fragment Loading for Structures; - DOE/EV 06194-5, and Explosives Safety Manual. Additionally, this action is needed because the present facility, the Building 217-F vault, does not comply with the above criteria for storage of munitions and explosives, and has been cited with seven occupational safety violations by DOE safety engineers. The most serious noted violations are due to the existing lack of appropriate storage space: munitions stacked directly against masonry walls, weapons stored in the same magazine as the munitions, inoperable ventilation system, inadequate air circulation, and the existence of electrical fans and switchgear within the magazine.

33714 (LA-SUB–93-201) **Pyrotechnic study and test: Final report.** Smith, R.D. (Unidynamics/Phoenix, AZ (US)); Fronabarger, J.W. Los Alamos National Lab., NM (United States); Unidynamics/Phoenix, Inc., AZ (United States). 14 Jan 1992. 12p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93019297. Source: OSTI; NTIS; GPO Dep.

Unidynamics/Phoenix entered into LANL contract #9-X51-D9928-1 on March 11, 1991. The contract was to perform chemical analysis and provide analytical data, provide test data from functioning units, build and test pyrotechnic devices and fabricate and test approximately 100 pyrotechnic devices to approximate the chemical and functioning characteristics of the devices from the Army inventory. Because of government regulations, it became nearly impossible to ship the units from White Sands to Unidynamics. Consequently a series of functional tests were conducted at White Sands Missile Range. Comments on the functional tests are included herein. In addition, small scale tests were conducted at Unidynamics. These tests were to demonstrate a so called "line" charge and a "walking" charge. A discussion of these two charges is presented. The program was put on hold on November 6, 1991 and subsequently reopened to prepare and submit this report.

33715 (LA-UR–93-2345) **Response of inclined electromagnetic particle velocity gauges in shocked liquids.** Gustavsen, R.L.; Sheffield, S.A.; Alcon, R.R. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930676–20: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93018352. Source: OSTI; NTIS; GPO Dep.

Multi-element electromagnetic particle velocity gauges are made by sandwiching aluminum conductive elements between sheets of Teflon. The 60 μm thick membrane is then placed in the liquid sample at an angle so that particle velocities are measured at multiple depths. In this paper we report particle velocity measurements in the liquids nitromethane, bromoform and diiodomethane using Teflon gauges inclined to the shock front by 0, 10, 20, and 30 degrees. The particle velocity measured by the inclined gauges was either higher or lower than the "correct" particle velocity measured by non inclined gauges. The error in the measured particle velocity is a function both of the relative impedance of the liquid and Teflon membrane, and of the angle of the gauge to the shock front. Measured velocities can be in error by $\pm$ 10% for gauges inclined 30°.

Analysis shows that some of the error is caused by the liquid slipping past the Teflon membrane.

33716 (LA-UR–93-2347) **Particle velocity and stress measurements in low density HMX.** Sheffield, S.A. (Los Alamos National Lab., NM (United States)); Gustavsen, R.L.; Alcon, R.R.; Graham, R.A.; Anderson, M.U. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930676–18: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93018350. Source: OSTI; NTIS; GPO Dep.

Magnetic particle velocity gauges and PVDF stress rate gauges have been used to measure the shock response of low density HMX explosive (1.24 g/cm^3). In experiments done at LANL, magnetic particle velocity gauges were located on both sides of the explosive. In nearly identical experiments done at SNL, PVDF stress rate gauges were located at the same positions. Using these techniques both particle velocity and stress histories were obtained for a particular experimental condition. Loading and reaction paths were established in the stress-particle velocity plane for each input condition. This information was used to determine that compacted HMX has an impedance close to that of Kel-F and also that a global reaction rate of $\approx 0.13\ \mu s^{-1}$ was observed in HMX shocked to about 0.8 GPa. At low input stresses the transmitted wave profiles had long rise times (up to 1 μs) due to the compaction processes.

33717 (LA-UR–93-2348) **Contained high explosive firing facility (CHEFF).** Stacy, H.L. (Los Alamos National Lab., NM (United States)); Seitz, W.L.; Wackerle, J.; Polcyn, M.; Esparza, E. Los Alamos National Lab., NM (United States); Southwest Research Inst., San Antonio, TX (United States). 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930676–24: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93018349. Source: OSTI; NTIS; GPO Dep.

A cylindrical vessel capable of totally containing the products and shrapnel resulting from the detonation of 10 kg of TNT (or equivalent) has been designed and built by Southwest Research Institute for and according to the requirements of the Detonation Systems Group (M-7) of Los Alamos National Laboratory. The vessel is 6.0-m long by 3.6-m diameter and is manufactured of 50-mm (elliptical end caps) and 38-mm (cylindrical walls) thick high-strength steel (HY-100). The cylindrical walls of the vessel are lined with 13-mm thick replaceable steel plates for shrapnel protection. The floor is made of steel-covered concrete. Ten large-aperture (254 mm) optical ports are available for instrumentation and four ports are provided for cabling and plumbing. Two qualifying detonation tests of 8.8 kg of C-4 explosive (equivalent to 10 kg TNT) have shown that the maximum strain produced is less than 78% of the elastic limit. The vessel is installed in a converted outdoor firing facility that has been modified to include an insulated and heated metal building to house the vessel and additional instrumentation. A computer-based system for data acquisition, firing control, and the monitoring of vessel response is described.

33718 (LA-UR–93-2547) **Initiation of preshocked high explosives PBX-9404, PBX-9502, PBX-9501, monitored with in-material magnetic gauging.** Mulford, R.N.; Sheffield, S.A.; Alcon, R.R. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–21: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93018365. Source: OSTI; NTIS; GPO Dep.

Desensitization of explosives by preshocking is being studied using the well-supported plane shock waves generated by a gas gun. Evolution of the waves in the explosive is monitored using in-material multiple magnetic gauges to measure particle velocity in the lagrangian frame, over $\approx 3\mu$s of run. PBX-9404, PBX-9502 have been studied, at pressures up to 10.5 GPa. A substantial extension of the run to detonation is observed in PBX-9404, with the run beginning approximately at the end of the preshocked region. A reactive wave is observed while the preshock persists in both PBX-9404 and PBX-9501, but evidently does not contribute to the detonation wave or shorten the run to detonation. PBX-9502 is inert at pressures accessible with the gas gun, but serves to clarify the progress of multiple shocks over the off-Hugoniot EOS surface and the shock dynamics of wave coalescence.

33719 (LA-UR–93-2548) **Velocimetry studies on the prompt initiation of PBX 9502.** Wackerle, J.; Stacy, H.L.; Seitz, W.L. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–20: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93018364. Source: OSTI; NTIS; GPO Dep.

In this paper, a description is given for the extension and refinement of the methods used for the investigation of the reaction-rate evolution in the prompt initiation of PBX9502 (95 wt percent TATB/ 5 wt percent Kel F 800). A further improvement was realized in the experimental configuration of 9SD, which already was sufficient to resolve considerable detail in the detonation reaction zones. In this study, the interface velocity histories where obtained on specimens with thicknesses less that the approximately 3-mm run distance needed to establish a nearly steady detonation reaction zone with the driving system. Within this experimental range, an initally rounded character was observed in velocity histories, and the quantitative measurements of the evolution of this feature during the prompt initiation buildup process provide the significant new experimental information of this paper.

33720 (LA-UR–93-2550) **Reflected-shock initiation of explosives.** Ferm, E.N.; Hull, L.M. Los Alamos National Lab., NM (United States). 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–22: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93018559. Source: OSTI; NTIS; GPO Dep.

In a study of initiations caused by reflected shock from a high-impedance boundary, attempts to establish sufficient conditions for initiative are described. Shock polar analysis is used to discover the ranges of various flow regimes, general shock structures and pressure estimates of states behind the reflected wave. Using this knowledge, wave structure growth rates from hydrocode simulations are estimated and standard-shock initiation criteria are used; experiments are designed in which the initiation from a reflected-shock wave structure appears likely. Two experiments are described in which a reflected-shock wave from a uranium surface initiated PBX 9502. The experimental evidence is in good agreement with the assumptions and results of the analysis.

33721 (UCRL-CR–113692) **Exploratory depth-of-burst experiments.** Reichenbach, H. (Fraunhofer-Institut fuer Kurzzeitdynamik - Ernst-Mach-Institut (EMI), Freiburg im Breisgau (Germany)); Behrens, K.; Kuhl, A. Lawrence Livermore National Lab., CA (United States); Fraunhofer-Institut fuer Kurzzeitdynamik - Ernst-Mach-Institut (EMI), Freiburg im Breisgau (Germany); R and D Associates, Los Angeles, CA (United States). 12 Dec 1991. 45p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019609. Source: OSTI; NTIS; GPO Dep.

This report describes the first small-scale explosion experiments with aerated grout (i.e., YTONG). Apart from data referring to crater depth and volume versus depth of burst (DOB), isobaric DOB curves in the range of 1.5 psi $\leq p \leq$ 15 psi were established. The comparison with previous HOB values shows that the ground range to a given overpressure is considerably reduced with increasing depth of burst. The authors plan to continue the airblast investigations with different types of soil materials.

33722 (UCRL-CR–114509) **Temperature of aircraft cargo flame exposure during accidents involving fuel spills.** Mansfield, J.A. Lawrence Livermore National Lab., CA (United States). Jan 1993. 299p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (DDV–93-0004). Order Number DE93019633. Source: OSTI; NTIS; GPO Dep.

This report describes an evaluation of flame exposure temperatures of weapons contained in alert (parked) bombers due to accidents that involve aircraft fuel fires. The evaluation includes

two types of accident, collisions into an alert aircraft by an aircraft that is on landing or take-off, and engine start accidents. Both the B-1B and B-52 alert aircraft are included in the evaluation.

33723 (UCRL-ID–113275) **The use of post detonation analysis of stable isotope ratios to determine the type and production process of the explosive involved.** McGuire, R.R.; Velsko, C.A.; Lee, C.G.; Raber, E. Lawrence Livermore National Lab., CA (United States). 5 Mar 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018497. Source: OSTI; NTIS; GPO Dep.

The detonation of a series of explosives was performed in a controlled manner to collect the resulting, solid residue or "soot." This residue was examined to determine the ratios of the stable carbon, hydrogen, and nitrogen isotopes. The goal of the experiment was to determine if these ratios could be used to indicate, from the post detonation residues, the type and origin of the detonated explosive. The ratios of the stated stable isotopes in the undetonated explosive were also determined. Despite some reservations in the quality of the data resulting from contamination by nonexplosive components, certain trends can be discerned. (1) Carbon isotopes allow aromatic explosives to be distinguished from nonaromatic explosives. This trend seems to carry through the detonation so that the distinction might be made after the fact. (2) The amination process for TATB can be detected through the hydrogen and, to some extent, the nitrogen isotope ratios. Unfortunately, the data are not sufficiently good to determine if this differential carries through the detonation. (3) The relative magnitude and sign of the nitrogen isotope ratio seems to carry through the detonation: some exchange with atmospheric nitrogen is probable. Even though this set of experiments must also be viewed as preliminary, there is a definite indication that certain qualitative characteristics of explosives can be detected after the detonation. This "signature" could have application to both intelligence and counter terrorism.

33724 (UCRL-ID–113360) **Slow cook-off test results for RX-08-FK in a toroidal composite vessel: Test Two.** von Holtz, E. (Lawrence Livermore National Lab., CA (United States)); Bretl, D.; Spingarn, J.; Ferrario, M.; Didlake, J. Lawrence Livermore National Lab., CA (United States); Sandia National Labs., Livermore, CA (United States). Feb 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC04-76DP00789. Order Number DE93017961. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A second slow cook-off test was conducted, during which a toroidal composite vessel containing 6.5 kg of RX-08-FK Paste Extrudable Explosive was subjected to a gradually increasing thermal environment of 3.3°C/hr (after an initial 8 hr soak at 74°C). This test differed from the first test in that the metal end pieces in the composite vessel were secured in place with set-screws. Ten strain gauges and five thermocouples located at various points around the toroid were used to provide data. In addition to that instrumentation, the entire test was documented with two video cameras. Post-test inspection indicated that the result of the test was an explosion, which was more violent than the previous test, and occurred after 36 hours, at an oven temperature of 165°C. Comparing the results to those of the first slow cook-off test, In which the metal end pieces were adhesively bonded into place without set screws, shows that the effect of the increasing restraint is to lower the reaction temperature by about 18°C and to slightly increase the violence of rejection. Neither observation suggests any problems with the underlying safety theme.

33725 (UCRL-ID–113364) **2,4-dinitroimidazole: A practical insensitive high explosive?.** Jayasuriya, K. (Army Research and Development Center, Dover, NJ (US)); Damauarapu, R.; Simpson, R.L.; Coon, C.L.; Coburn, M.D. Lawrence Livermore National Lab., CA (United States); Los Alamos National Lab., NM (United States). Mar 1993. 6p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;W-7405-ENG-36. Order Number DE93017962. Source: OSTI; NTIS (US Sales Only); GPO Dep.

As part of an effort to develop new explosives and propellants with enhanced properties, the authors have discovered that 2,4-dinitroimidazole (2,4-DNI) may be a good material for both applications. In regards to application as a high explosive 2,4-DNI may be a practical alternative to TNT and TATB. The requirements here are that it has performance at least as good as TNT, that it is insensitive, and that it is low cost. As is shown in this work, it appears that 2,4-DNI may meet all three of these goals. Performance measurements and thermochemical code predictions indicate that it is 15–22% more energetic than TATB in terms of metal acceleration. Calculationally it also appears that the detonation products are very hot which suggests it may be a good substitute for TNT, RDX, and HMX in composite explosive formulations. Furthermore, the preliminary measurements indicate that its safety properties are very good. Impact sensitivity of neat 2,4-DNI ranges from 100 cm to greater than 320 cm (HMX approx. 30 cm) depending on the purity of the material. The less pure material is less sensitive in a way that is not yet understood. In regards to thermal sensitivity it is superior to the nitramines. Finally, the cost of 2,4-DNI may be quite low in production.

33726 (UCRL-ID–113563) **LX-17 chemical kinetic material model for Chemical TOPAZ2D.** Hendricks, J.T. Lawrence Livermore National Lab., CA (United States). Feb 1993. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014363. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A chemical reaction kinetic material model for Chemical TOPAZ2D has been developed for modeling burning of LX-17 high explosive. The model was developed to predict warhead thermal response when subjected to fuel and/or propellant fires. Prior to this work, material models have been unavailable for Chemical TOPAZ2D to accurately predict the thermal response of burning LX-17. Numerical results compared to George Bloom's experimental test in 1983 indicate that the burn rate and burn temperature can be simulated with excellent correlation when using, the present LX-17 material model. Numerical modeling, also have insight to the shape of the burn front and the thermal propagation. Observations indicate that a higher burn rate resulted from the experimental test over the adiabatic burn rate of LX-17. This effect was due to the thermal diffusion down the outer stainless steel can wall resulting in LX-17 preignition. The burn rate of LX-17 from George Bloom's experiment was recorded as 3.7-3.9 mm/min. Using the LX-17 material model, a one-dimensional numerical simulation indicates that the adiabatic burn rate is 2.2 mm/min. Since the burning of LX-17 within a weapon is closer to an adiabatic burn, the lower estimate for burn rate shows an enhancement in thermal protection.

33727 (UCRL-JC–112314) **The variation of the ignition temperature of solid explosives as a function of heating rate.** Creighton, J.R. Lawrence Livermore National Lab., CA (United States). 23 Apr 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9305189–5: 1993 joint Army, Navy, NASA, Air Force (JANNAF) Propulsion Systems Hazards Subcommittee meeting, Ft. Lewis, WA (United States), 10-14 May 1993). Order Number DE93017189. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report was motivated by a need to calculate the time when the high explosive in a nuclear weapon will ignite if the weapon is heated in a fire. Numerical calculations were done to determine the ignition temperature of a slab of explosive where the temperature of one surface is $T_o + \beta t$ and there is no heat flow through the other surface. Calculation were done using three models of the chemical kinetics: a single Arrhenius reaction rate, 3.5×10^{19} exp(−30,000/T), and McGuire and Tarver's simplified kinetics models for HMX (octahydro-1,3,5,7-tetranitro-1,3,5,7–tetrazocine) and TATB (2,4,6-trinitro-1,3,5-benzentriamine). The numerical results show that the ignition temperature of an explosive depends on the heating rate, β. The results can be fit by $T_{ign} = T_1/(1-b1n\beta)$ (Eq. 1) using appropriate values of the two fitting parameters, T_1 and b. Each kinetics model yields different fitting parameters. For TATB T_1 = 678 K and b = 0.068; for HMX T_1 = 559 K and b = 0.026; and for a single Arrhenius rate coefficient, T_1 = 610 K and b = 0.0274. These fits are consist with the limited relevant experimental data for TATB and HMX. A mathematical model is derived to explain this fitting function. For these boundary conditions the steady state temperature in the slab has a gradient near the heated surface that is proportional to the heating rate. An equation for the temperature

rise due to the chemical reaction shows that it is a small perturbation so long as the surface temperature is less than some critical value, T_{ign}. At temperatures above T_{ign} there is no solution for the chemical contribution to the heating rate. This is thermal runaway. Numerical results from the model agree with Eq. 1 for the case of a single Arrhenius rate coefficient. With multi-step kinetics mechanisms for HMX and TATB agreement with Eq. 1 depends on which step is chosen as rate controlling.

Statistical Quality Control (SQC) is a broad term defining procedures that can be employed during production to insure that parts are produced having specified characteristics and performance. In developing complex systems of systems whose performance cannot be tested as entities, methods exist to identify components and subsystems whose failures, degradations, and variations most severely erect system level performance. Once identified, two methods may be employed to reduce or eliminate the system effects caused by such critical components - (1) design change employing such techniques as redundancy, proliferation, and spatial separation, and (2) component quality improvement. This paper summarizes the SQC methods and procedures that can be employed in mass producing electronic parts - ICs, SRAMs, buffers, capacitors, connectors - to reduce variability and insure performance to specified radiation, current, voltage, temperature, shock, and vibration levels. Producing such quality parts reduces uncertainties in performance and will aid materially in validating the survivability of components, subsystems, and systems to specified threats.

33729 (DOE/FTR–93013406) **Democratization of a society and military security conference, Moscow, Russia, June 1–4, 1992: Foreign trip report, 30 May–7 June 1992.** Hopkins, J. (Los Alamos National Lab., NM (United States)); Brown, G.S. Sandia National Labs., Albuquerque, NM (United States). 27 Aug 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013406. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses travel to Russia to attend the fourth conference organized by the Association "Armed Forces and Society." The chief spokesman and apparent leader of the Society is Maj Gen (Ret) Nikita Chaldymov. Chaldymov was a leading advocate of reform, i.e., liberalization of the Red Army prior to his retirement. He has forged contacts with a number of the Western study institutes represented in the conference and is using those contacts to promote a dialogue between the various elements of the Russian defense community and Western organizations. This report details this promotion effort.

33730 (DOE/FTR–93013717) **Travel to the UK to attend the third international conference on dense z pinches and to discuss new soft x-ray test capabilities at the Atomic Weapons Establishment: Foreign trip report, April 17–24, 1993.** Spielman, R.B. Sandia National Labs., Albuquerque, NM (United States). 26 Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013717. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This trip report describes a visit by Rick B. Spielman to the Imperial College in London, UK and to the Atomic Weapons Establishment in Aldermastron. The Third International Conference on Dense Z Pinches was sponsored by the Imperial College. This is the premier conference on Z pinches and is held every 3-4 years. A talk titled "Implosion Dynamics and Heating Mechanism of Wire Array Z Pinches." A proceedings was written as well and a copy is included in this report. The pulsed power group headed by Dr. Mike Goodman at AWE(A) was visited where the author talked about the latest pulsed power designs for soft x-ray sources and about the x-ray test capabilities of a possible new driver. Dr. Goodman talked about the status of the x-ray imaging diagnostics at AWE(A).

33731 (DOE/FTR–93015635) **Travel to United Kingdom to investigate practices and technology at the Atomic Weapons Establishments (AWE): Foreign trip report, May 10–14, 1993.** Marshall, R.P. (Battelle Pantex, Amarillo, TX (United States)); Papp, A.G.; Kenagy, C.K.; Pool, G.E.; Wieck, R.L.; Hunstad, W.J.; Hollerbach, R.R. Battelle Pantex, Amarillo, TX (United States). 9 Jun 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. Order Number DE93015635. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Through briefings and tours, we investigated the practices and technologies applicable to pantex, especially in the disassembly operations. The observations of the pantex team are organized around the topics of general, safety, radiation dose, tooling and facilities, and organization. These observations must be viewed in context with the process, production requirements and time restraints of Pantex and our DOE mission. Many of the AWE approaches and practices emulate those now being used in US industry and government plants. Some of them have been part of the Cell/Bay effectiveness in nuclear weapons operations.

33732 (DOE/NV/10630–T6) **Blind shaft drilling: The state of the art.** Rowe, P.A. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). 20 Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-89NV10630. Order Number DE93016196. Source: OSTI; NTIS; GPO Dep.

This report discusses the "Art" of blind shaft drilling which has been in a continual state of evolution at the Nevada Test Site (NTS) since the start of underground testing in 1957. Emplacement holes for nuclear devices are still being drilled by the rotary drilling process, but almost all the hardware and systems have undergone many changes during the intervening years. Blind shaft drilling and tunnel construction technologies received increased emphasis with the signing of the LTBT in 1963.

33733 (DPST–62-200-Vol.3) **SRL history, Volume 3, E.I. DuPont de Nemours and Co., Inc.** Plant Histories. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. Jun 1984. 169p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–603). Order Number DE93016674. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This volume summarizes the major activities and accomplishments in Power Reactor and Fuel Technology at the Savannah River Laboratory.

33734 (KCP–613-5244) **Quality metrics for product defectiveness at KCD.** Grice, J.V. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jul 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93019773. Source: OSTI; NTIS; GPO Dep.

Metrics are discussed for measuring and tracking product defectiveness at AlliedSignal Inc., Kansas City Division (KCD). Three new metrics, the metric (percent defective) that preceded the new metrics, and several alternatives are described. The new metrics, Percent Parts Accepted, Percent Parts Accepted Trouble Free, and Defects Per Million Observations, (denoted by PPA, PATF, and DPMO, respectively) were implemented for KCD-manufactured product and purchased material in November 1992. These metrics replace the percent defective metric that had been used for several years. The PPA and PATF metrics primarily measure quality performance while DPMO measures the effects of continuous improvement activities. The new metrics measure product quality in terms of product defectiveness observed only during the inspection process. The metrics were originally developed for purchased product and were adapted to manufactured product to provide a consistent set of metrics plant- wide. The new metrics provide a meaningful tool to measure the quantity of product defectiveness in terms of the customer's requirements and expectations for quality. Many valid metrics are available and all will have deficiencies.

These three metrics are among the least sensitive to problems and are easily understood. They will serve as good management tools for KCD in the foreseeable future until new flexible data systems and reporting procedures can be implemented that can provide more detailed and accurate metric computations.

33735 (LA-SUB–93-204) **Department of Energy weapons complex sizing study.** Los Alamos National Lab., NM (United States); BDM International, Inc., McLean, VA (United States). 2 Nov 1987. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93018271. Source: OSTI; NTIS; GPO Dep.

Contained in the National Defense Authorization Act for FY 1988-89 (H.R. 1748, Section 3133), is a requirement for the President to conduct a study on the nuclear weapons complex for the purpose of determining the overall size and productive capacity necessary to meet national security objectives. Based on the study, the President is directed to formulate a plan to modernize the nuclear weapons complex including actions necessary to ensure operation of facilities in a safe and environmentally acceptable manner; a schedule for implementation of the plan; and the estimated costs of implementation of the plan. The Act calls for submission of a Report to the appropriate committees of the Congress including recommendations resulting from the Study and a description of the Plan. The report is to be submitted by February 15, 1988. In contrast to the Bill, the Committee report on H.R. 1748, Section 3133, calls for both a Study and a Plan to be submitted one year later than the aforementioned report, and puts much greater stress on recommendations concerning the capability of the weapons complex to be operated in a safe and environmentally acceptable manner. Thus, the Report will be submitted by President Reagan and the Study and Plan will be submitted by a new president. This report discusses the implications of this schedule, suggests a plan of action for DOE, and summarizes possible deliverables: Predictable planning baseline; Environment, safety and health; Special nuclear material availability; Non-defense programs work; Content versus pace; Testing; Weapons research, development and testing versus production and stockpile integrity versus new builds; Integration with DOD programming cycle; Duality in research and development; and Program packaging.

33736 (SAND–91-1269) **The unique signal concept for detonation safety in nuclear weapons.** Spray, S.D.; Cooper, J.A. Sandia National Labs., Albuquerque, NM (United States). Jun 1993. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018520. Source: OSTI; NTIS; GPO Dep.

The purpose of a unique signal (UQS) in a nuclear weapon system is to provide an unambiguous communication of intent to detonate from the UQS information input source device to a stronglink safety device in the weapon in a manner that is highly unlikely to be duplicated or simulated in normal environments and in a broad range of ill-defined abnormal environments. This report presents safety considerations for the design and implementation of UQSs in the context of the overall safety system.

33737 (SAND–93-0704) **Nuclear weapon reliability evaluation methodology.** Wright, D.L. (Sandia National Labs., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States). Jun 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018047. Source: OSTI; NTIS; GPO Dep.

This document provides an overview of those activities that are normally performed by Sandia National Laboratories to provide nuclear weapon reliability evaluations for the Department of Energy. These reliability evaluations are first provided as a prediction of the attainable stockpile reliability of a proposed weapon design. Stockpile reliability assessments are provided for each weapon type as the weapon is fielded and are continuously updated throughout the weapon stockpile life. The reliability predictions and assessments depend heavily on data from both laboratory simulation and actual flight tests. An important part of the methodology are the opportunities for review that occur throughout the entire process that assure a consistent approach and appropriate use of the data for reliability evaluation purposes.

33738 (UCRL-ID–114809) **Risk assessment of the arming and firing system at the Nevada Test Site.** Altenbach, T. (Lawrence Livermore National Lab., CA (United States)); Ferrell, W.; Greybeck, E. Lawrence Livermore National Lab., CA (United States). Jul 1993. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019555. Source: OSTI; NTIS; GPO Dep.

Assuring the safety of the arming and firing (A/F) system for nuclear device testing has been an important concern for many years. This study is concerned with the potential for a nuclear explosive safety incident due to some abnormal conditions, component failures, human errors, or external natural phenomena affecting the A/F system. Intentional human actions such as sabotage or terrorist subversion were excluded from this analysis. The safety incident under analysis is the explosive dispersal of plutonium from the device. The time of concern begins when the device and the A/F equipment are located physically adjacent at ground zero, until the device is fully stemmed. This time is divided into the following phases: device delivery and installation, hot dry run testing, and device insertion. The authors have produced both qualitative and quantitative results. They found that the A/F system is well designed, and operated by dedicated personnel. The continuous testing done on the system insures that the hardware will function safely and reliably to a high confidence level. Although very thorough administrative controls are followed and written checklists are well understood by experienced and knowledgeable people, the opportunity for human error to cause a detonation of the device is present. Even though several human errors are required for a safety incident, the potential for a common cause failure resulting from times such as miscommunication and confusion threatens to bypass the engineered safety redundancies and administrative controls. The authors determined that human interaction, during the hot dry run phase and the insertion phase, are the most important factors in the safety of the A/F system, followed by the threat of lightning during the insertion phase.

33739 (UCRL-JC–113334) **Site selection and containment evaluation for LLNL nuclear events.** Olsen, C.W. Lawrence Livermore National Lab., CA (United States). Jun 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9309103–1: 7. symposium on containment of underground nuclear explosions, Kent, WA (United States), 15-16 Sep 1993). Order Number DE93016997. Source: OSTI; NTIS; INIS; GPO Dep.

During approximately the past decade, the site selection process at LLNL has evolved as the Test Program needs and resources have changed, containment practices have been modified, and the DOE and other regulatory agencies have become more restrictive. Throughout this period the Containment Program and the Field Operations Program at LLNL have managed a cooperative effort to improve site selection. The site selection process actually is three inter-related tasks, namely, selection of a stockpile hole for a specific nuclear test, selection of a drill site for a stockpile hole, and selection of a new drill site for a specific test. Each proposed site is carefully reviewed for known or projected geologic structure and medium properties, nearby holes, containment experience in the region, likelihood of drilling problems, programmatic need for a given depth of hole, and scheduling of Test Program events and resources. By using our data bank, our general knowledge of the Nevada Test Site (NTS) geology, and other information sources, as well as our background in drilling large diameter holes at the NTS, we have been able to optimize our use of NTS real estate and programmatic resources. The containment evaluation of a site is facilitated by considering the location before the hole is drilled. Discuss imposed restraints and our criteria and guidelines for site selection and assignment of events to specific holes, along with the factors that influence selection of a Working Point (WP) depth. Since siting and containment evaluation are strongly related, most major factors related to the containment evaluation process will also be reviewed.

33740 (UCRL-LR–108906) **Design, development and evaluation of a precision air bearing rotary table with large diameter through-hole.** Accatino, M.R. Lawrence Livermore National Lab.,

CA (United States). Nov 1991. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019117. Source: OSTI; NTIS; GPO Dep.

Thesis submitted to University of California, Davis.

A large diameter precision air bearing rotary table with a 16.0 inch diameter through-hole was designed, fabricated and tested in the course of this research. The rotary table will be used in conjunction with a specialized, computer controlled precision inspection machine being designed for the Department of Energy's (DOE) Nuclear Weapons Complex (NWC). The design process included a complete engineering analysis to predict the final performance of the rotary table, and to ensure that the rotary table meets the required accuracy of 4.0 microinches of total radial (3.5 microinches average radial) and 4.0 microinches total axial (3.5 microinches average axial) errors. The engineering analysis included structural deformation, thermal sensitivity and dynamic analyses using finite element methods in some cases, as well as other analytic solutions. Comparisons are made between predicted and tested values, which are listed in the rotary table error budget. The rotary table performed as predicted with measured axial and radial stiffnesses of 1.1E06 lbf/inch and 2.9E06 lbf/inch, respectively, as well as average radial, axial and tilt errors of 2.5 microinches, 1.5 microinches, and less than 0.05 arcseconds, respectively.

33741 (UCRL-LR–113578) **Propellants and explosives in ballistic missiles.** James, E. Lawrence Livermore National Lab., CA (United States). 15 Jul 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018914. Source: OSTI; NTIS (US Sales Only); GPO Dep.

At the time the propellants were selected for the Submarine Launched Ballistic Missile (SLBM) C-4 program, a Hazard Assessment Panel was formed and a number of safety tests were done under the direction of the panel. The high specific impulse propellants needed for target range contained as much as 50% HMX. Fears, which later were proven true, were expressed regarding the safety of these propellants. The standard hazard tests, including the Lawrence Livermore National Laboratory SUSAN, the Pantex SKID, and the Naval Ordnance Laboratory (NOL) GAP test, were done on the candidate propellants. During the time of the joint R and D efforts, important advances were made in solid propellant formulation and manufacturing technology. The behavior of the non-Chapman-Jouget (CJ) detonations of the high- energy propellants, DDT and XDT, were better recognized. Perhaps the single most important advance was the introduction of the nitrate ester polyether (NEPE) binder by JV in the propellant formulation. The most important fundamental advance was the improved understanding of the relation between constitutive properties, fracture mechanics, and threshold of initiation of reaction. For instance, LLNL, in conjunction with Stanford Research Institute (SRI), showed that ignition was induced in a NEPE first-stage propellant by spallation caused by reflection of a 0.5-GPa impact elastic wave. Combined with the improved formulations and the experimental program, the flight tests–and now fleet safety records–have produced confidence in the overall safety of current propellants. There is, however, a nagging doubt, emphasized by the Drell report, that the intrinsic ease of shock initiation of the high-energy NEPE propellants could make possible a catastrophic accident with accompanying plutonium dispersal. Such an accident would have grave consequences in our national defense stance.

33742 (WSRC-RP–93-755) **Vitrification of excess plutonium.** McKibben, J.M.; Benjamin, R.W.; Bickford, D.F.; Fernandez, L.P.; Jackson, W.N.; McDonell, W.R.; Moore, E.N.; Parks, P.B.; Plodinec, M.J.; Rajczak, W.M.; Skiles, S.K.; Wicks, G.G. Westinghouse Savannah River Co., Aiken, SC (United States). May 1993. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93018190. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The national and international interest in the disposition of excess plutonium (Pu) from dismantled nuclear weapons and other sources has grown considerably within the past year. Although a variety of disposition options have been proposed, three major options for the excess plutonium are receiving serious consideration: storing the plutonium (after minimal processing) in safeguarded vaults; using the plutonium in fuel for nuclear reactors, thus denaturing the plutonium as well as producing electricity; and vitrifying the plutonium in borosilicate glass, with or without the addition of high-level waste (HLW), for placement in safeguarded vaults and/or entombment in a deep geologic repository. The policy decision on whether to store the excess plutonium indefinitely, use/denature it in power reactors, or dispose of it in vitrified form will be influenced by a number of technical and socio-political factors. This report addresses key technical factors that would be important to the third disposition option, vitrification. No recommendation is made regarding vitrification versus the other two disposition options, or which vitrification option should be pursued if vitrification is chosen as the mode of disposition.

4503 Nuclear Explosion Detection

33743 (BNL–49247) **Proliferation detection using a remote resonance Raman chemical sensor.** Sedlacek, A.J.; Chen, C.L.; Dougherty, D.R. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930749–52: 34. annual meeting of the Institute of Nuclear Materials Management, Scottsdale, AZ (United States), 18-21 Jul 1993). Order Number DE93018847. Source: OSTI; NTIS; GPO Dep.

The authors discussed the potential of the resonance Raman chemical sensor as a remote sensor that can be used for gases, liquids or solids. This spectroscopy has the fundamental advantage that it is based on optical fingerprints that are insensitive to environmental perturbations or excitation frequency. By taking advantage of resonance enhancement, the inelastic scattering cross-section can increase anywhere from 4 to 6 orders of magnitude which translates into increased sensing range or lower detection limits. It was also shown that differential cross-sections as small as 10^{-27} cm^2/sr do not preclude the use of this technique as being an important component in one's remote-sensing arsenal. The results obtained in the early 1970s on various pollutants and the more recent work on atmospheric water cast a favorable light on the prospects for the successful development of a resonance Raman remote sensor. Currently, of the 20 CW agent-related "signature" chemicals that the authors have investigated, 18 show enhancements ranging from 3 to 6 orders of magnitude. The absolute magnitudes of the measured resonance enhanced Raman cross-sections for these 18 chemicals suggest that detection and identification of trace quantities of the "signature" chemicals, through a remote resonance Raman chemical sensor, could be achieved.

33744 (SAND–93-1696) **Evaluation of the Deployable Seismic Verification System at the Pinedale Seismic Research Facility.** Carr, D.B. Sandia National Labs., Albuquerque, NM (United States). Aug 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93040212. Source: OSTI; NTIS; GPO Dep.

The intent of this report is to examine the performance of the Deployable Seismic Verification System (DSVS) developed by the Department of Energy (DOE) through its national laboratories to support monitoring of underground nuclear test treaties. A DSVS was installed at the Pinedale Seismic Research Facility (PSRF) near Boulder, Wyoming during 1991 and 1992. This includes a description of the system and the deployment site. System performance was studied by looking at four areas: system noise, seismic response, state of health (SOH) and operational capabilities.

33745 (UCRL-ID–113780) **On-site inspection: A brief overview and bibliography of techniques pertinent to assessing suspected nuclear test sites.** Carrigan, C.R. Lawrence Livermore National Lab., CA (United States). Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019583. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide a brief overview and bibliography of those techniques that may have application for the evaluation of a site to determine if a high energy release event is nuclear in nature. This effort is motivated by recognition of the changing world political climate and the perception that low yield

and non-proliferation issues will grow in importance as countries become increasingly involved as signators to treaties that are intended to limit the development and testing of nuclear weapons. Along with an increasing interest in such issues is the awareness of the need to implement improved capabilities for treaty monitoring programs that must deal with assessing suspicious occurrences of high energy release events. In preparing this report, it is recognized that monitoring can take two main forms. The first involves the resolution of unidentified events detected by seismic and satellite National Technical Means. Events of an indeterminate nature could occur world-wide and could induce tension in neighboring countries. If an on-site measurement capability were available, a monitoring team could be sent to the suspected site of an event to take measurements that could confirm or disprove the occurrence of a clandestine nuclear test. The second monitoring form is the confirmation that a clandestine event is not masked by a declared event. For example, a large mining explosion could mask a decoupled nuclear explosion. On-site measurements before and during the test could confirm that a clandestine event did not occur and could provide assurance that the party carrying out the explosion is not taking advantage of clandestine testing opportunities. 48 refs.

4504 Nuclear and Radiological Warfare

33746 (UCRL-ID–113660) **Effectiveness of nuclear interceptors against large single volume chemical/biological warheads.** Mendelsohn, E. Lawrence Livermore National Lab., CA (United States). Jan 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93017946. Source: OSTI; NTIS; GPO Dep.

In a continuing series of calculations which explore potential nuclear defenses against chemical and/or bacteriological warheads the author has now completed a study in which he postulated a large canister geometry. Instead of looking at a collection of smaller submunitions as done previously, he has now one single large volume of Sarin (a nerve agent). This is a more stressing case for nuclear defense, in that neutrons must traverse a long path in the hydrogenous solution if they are to deposit their energy in the region of Sarin farthest from the source. The author presents results from Monte Carlo calculations which indicate that differences in energy deposition between Sarin regions close to the source and those farthest from the source have increased very significantly.

33747 (SAND–93-0402C) **Calculations supporting HyperVelocity Launcher development.** Trucano, T.G.; Chhabildas, L.C. Sandia National Labs., Albuquerque, NM (United States). 1993. 4p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930676–25: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93018835. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories has developed a HyperVelocity Launcher (also referred to as HVL) in which a thin flier plate (nominally 1 mm thick) is launched to velocities in excess of 12 km/s. The length to diameter ratio of these launched flier plates varies from 0.02 to 0.06. The launch technique is based upon using structured, time-dependant, high-pressure, high-acceleration pulses to drive the flier plates. Such pulses are achieved by using a graded-density material to impact a stationary flier. A computational and experimental program at Sandia seeks to extend this technique to allow launching thick plates whose length-to-diameter ratio is 10 to 20 times larger than thin plates. Hydrodynamic codes are used to design modifications to the basic technique. The authors have controlled and used these effects to successfully launch a chunk-flier, consisting of 0.33 gm of titanium alloy, 0.3 cm thick by 0.6 cm in diameter, to a velocity of 10.2 km/s. This is the largest chunky size ever launched at this velocity from a gas gun configuration.

Section 313 of the Emergency Planning and Community Right-To-Know Act of 1986 (EPCRA) requires the annual submittal of toxic chemical release information to the US Environmental Protection Agency (EPA). The following document is the July 1993 submittal of the EPCRA Toxic Chemical Release Inventory Report (Form R). Included is a Form R for chlorine and for lead, the two chemicals used in excess of the established regulatory thresholds at the Hanford Site by the US Department of Energy, Richland Operations Office and its contractors during calendar year 1992.

33749 (ADEME–91-01-DOC-1, pp. 81-92) **Transports and air pollution in towns.** Morcheoine, A. Agence de l'Environnement et de la Maitrise de l'Energie, 75 - Paris (France). 1991. (In French). (CONF-9111328–: Colloquium on biomass: an energy source for the quality of environment, Paris (France), 27-28 Nov 1991). In *Biomass: an energy source for the quality of environment.* 245p. Order Number DE94700004. Source: OSTI; NTIS (US Sales Only).

Transportation is assumed to be nowadays, as industrial and heating pollutions are lessened and traffic has largely increased, the main cause for air pollution in cities. The various types of pollution causes from transportation are reviewed: gaseous pollutants (CO, NOx, ...) emitted by the engine combustion, pollutants due to fuel composition (Pb, sulfur, ...); air pollution control and abatement may be achieved by various means such as municipal traffic limitations, district planning, vehicle regulations (anti-pollution controls, fuel quality, engine characteristics and control, ...), air quality control, fuel substitution incentives (bio-fuels). The european regulations are discussed.

33750 (ANL/CMT-ACL/CP–77718) **On-line monitoring of incinerator emissions.** Mao, Zhuoxiong; Demirgian, J.C.; Hwang, E. Argonne National Lab., IL (United States). [1993]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930572–8: 12. annual international symposium on thermal treatment technologies - incineration conference, Knoxville, TN (United States), 3-7 May 1993). Order Number DE93017406. Source: OSTI; NTIS; INIS; GPO Dep.

As part of efforts to develop an on-line emissions monitor to detect specific organic compounds for incinerators, the authors tested a Fourier transform infrared spectrometer (FTIR) coupled with a long-path cell (LPC). A mixture of toluene, chlorobenzene, 1,1,1-trichloroethane, and trichloroethylene with elemental ratio C:H:Cl = 3:3.1:0.9 was incinerated in a methane/air flame. The effluent was continuously passed through a heated long-path cell. Eleven target compounds were simultaneously analyzed: methane, toluene, chlorobenzene, 1,1,1-trichloroethane, trichloroethylene, benzene, ethylene, hydrogen chloride, carbon monoxide, carbon dioxide, and water. During the testing, the incinerator temperature and the excess air ratio were deliberately changed to simulate both complete and incomplete combustion conditions in the incinerator. Test results indicate that the FTIR/LPC system can successfully follow concentration changes in the emissions that are associated with the change in the incinerator operations. In addition to carbon monoxide, methane, ethylene, and benzene have been found to be

major products of incomplete combustion of the mixture. In this paper, the authors also discuss problems related to obtaining representative calibration standards and to developing adequate methods for continuous monitoring of emissions.

33751 (ANL/ER/CP–80321) **Organic carbonyl compounds in Albuquerque, New Mexico, air: A preliminary study of the effects of oxygenated fuel use.** Popp, C.J. (New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Dept. of Chemistry); Zhang, Lin; Gaffney, J.S. Argonne National Lab., IL (United States); New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Dept. of Chemistry. Jun 1993. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9303207–1: Symposium on alternative fuels and the environment, Ann Arbor, MI (United States), 28 Mar - 2 apr 1993). Order Number DE93017748. Source: OSTI; NTIS; GPO Dep.

A suite of inorganic and organic species were analyzed for four 2–4 day time periods over a year in Albuquerque, New Mexico to determine baseline conditions for organic pollutants under the current air pollution control parameters. Concentrations of low molecular weight carbonyl compounds were relatively high compared with areas such as Los Angeles. Formio acid concentrations in air samples were significant even in winter. In addition, ratios of peroxypropionyl nitrate to peroxyacyetyl nitrate are higher than expected and may be related to the use of oxygenated fuels which are used to mitigate CO concentrations. The number of CO violations in Albuquerque has decreased steadily since 1982 and the downward trend has continued since 1989 when oxygenated fuel use was mandated. It is, therefore, difficult to correlate the drop in CO violations directly to the use of oxygenated fuels when such factors as fleet turnover, woodburning controls, emissions testing and meteorological conditions also may be playing significant roles. More detailed studies are needed to determine the specific relationship between the use of oxygenated fuels and the air quality in Albuquerque, New Mexico and similar urban areas in the western United States.

33752 (ANL/ES/CP–80079) **A comparison of wet and dry scrubbing systems for control of metals and dioxin/furan emissions from incinerators.** Farber, P.S.; Huang, H.S. Argonne National Lab., IL (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930364–6: Spring national meeting of the American Institute of Chemical Engineers, Houston, TX (United States), 28 Mar - 1 apr 1993). Order Number DE93017446. Source: OSTI; NTIS; GPO Dep.

In Europe and the United States, both wet and dry (including semidry) scrubbing systems are being used for control of emissions from all types of waste incinerators. In terms of the effectiveness of controlling particulates and acid gases, both types of scrubbing systems are capable of meeting US Environmental Protection Agency and European Community limits. Two of the more difficult emissions requirements for an incinerator air-pollution-control system to meet are the metals and the dioxin/furan limits. The dioxin/furan emissions requirement is especially stringent, calling for levels below 1 ng (10^{-9}) per cubic meter toxic equivalency. The differences between wet and dry scrubbing systems are discussed in this paper, as well as the advantages and disadvantages of each in its application to the control of emissions from incinerators. Particular attention will be paid to control of metals and dioxin/furan emissions and to the sampling and analysis techniques used to measure these emissions. Toxic equivalency factors will be explained, and in particular, the international toxic equivalency factor proposed as the US and European standard will be discussed. This paper will also address some of the techniques being employed to minimize the emissions of toxic compounds and discuss the use of combined wet and dry scrubbing systems for increased assurance of compliance.

33753 (BNL–49134) **Energy development and CO_2 emissions in China.** Xiaolin Xi (Carnegie-Mellon Univ., Pittsburgh, PA (United States)). Brookhaven National Lab., Upton, NY (United States). Mar 1993. 287p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93018385. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this research is to provide a better understanding of future Chinese energy development and CO_2 emissions from burning fossil fuels. This study examines the current Chinese energy system, estimates CO_2 emissions from burning fossil fuels and projects future energy use and resulting CO_2 emissions up to the year of 2050. Based on the results of the study, development strategies are proposed and policy implications are explored. This study first develops a Base scenario projection of the Chinese energy development based upon a sectoral analysis. The Base scenario represents a likely situation of future development, but many alternatives are possible. To explore this range of alternatives, a systematic uncertainty analysis is performed. The Base scenario also represents an extrapolation of current policies and social and economic trends. As such, it is not necessarily the economically optimal future course for Chinese energy development. To explore this issue, an optimization analysis is performed. For further understanding of developing Chinese energy system and reducing CO_2 emissions, a Chinese energy system model with 84 supply and demand technologies has been constructed in MARKAL, a computer LP optimization program for energy systems. Using this model, various technological options and economic aspects of energy development and CO_2 emissions reduction in China during the 1985-2020 period are examined.

33754 (BNL–49283) **Identification of source contributions to visibility-reducing organic aerosols in the vicinity of Grand Canyon National Park: Interim final report.** Mazurek, M.A. (Brookhaven National Lab., Upton, NY (United States)); Hallock, K.A.; Leach, M.; Mason-Jones, M.; Mason-Jones, H.; Salmon, L.G.; Winner, D.A.; Cass, G.R. Brookhaven National Lab., Upton, NY (United States); California Inst. of Tech., Pasadena, CA (United States). Dept. of Environmental Engineering Science. Jun 1993. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Contract CX-0001-8-0017. Order Number DE93018815. Source: OSTI; NTIS; GPO Dep.

Sulfates and carbonaceous aerosols are the largest contributors to the fine particle burden in the atmosphere near Grand Canyon National Park. While the effects of sulfate particles on visibility at the Grand Canyon has been extensively studied, much less is known about the nature and origin of the carbonaceous aerosols that are present. This disparity in understanding arises from at least two causes: aerosol carbon data for the region are less plentiful and many of the sources that could contribute to that organic aerosol are both diverse and not well characterized. The objective of this present study is to examine the origin of the carbonaceous aerosol at Grand Canyon National Park during the summer season based on molecular tracer techniques applied to source and ambient samples collected specifically for this purpose.

33755 (BNL–70341) **[Travel to England to participate in a symposium on carbon dioxide mitigation technologies]: Foreign trip report, March 23, 1993–April 1, 1993.** Steinberg, M. Brookhaven National Lab., Upton, NY (United States). 2 Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93014798. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler participated in the International Energy Agency (IEA) Carbon Dioxide Disposal Symposium, held at Christ Church College, Oxford, England during March 29–31, 1993. The title of presented paper, coauthored with Dr. Robert Borqwardt of the USEPA and Air Energy Engineering Laboratory (AEERL), in Research Triangle Park, North Carolina, and Dr. Yuanji Dong of the Hydrocarb Corporation in New York, NY, was "The Coprocessing of Fossil Fuels and Biomass for $C0_2$ Emission Reduction in the Transportation Sector." This meeting was a major international meeting bringing together technology developers from around the world to exchange information on global greenhouse $C0_2$ mitigation technologies. There were 230 registrants from 28 countries. A review of each session is given in this report.

33756 (CONF-9306207–1) **An interim protocol for the mitigation of radon in nonresidential buildings.** Wilson, D.L.; Dudney, C.S.; Gammage, R.B. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1. international workshop on indoor radon remedial action; Rimini

(Italy); 27 Jun - 2 jul 1993. Order Number DE93017855. Source: OSTI; NTIS; INIS; GPO Dep.

To date, the US Environmental Protection Agency has not published guidance for radon testing, diagnostics, or mitigation within large, nonresidential buildings. Current research indicates that large buildings may contain construction features or mechanical systems that could inhibit the installation or operation of a mitigation system. Health and safety issues such as asbestos and fire codes may further interfere with the installation process. Studies also show that elevated radon can be restricted to a particular area or room within a building and not be uniformly distributed. A four-step, sequential protocol has been developed to address these issues and facilitate large building radon mitigation.

33757 (DOE/FTR–93014810) **Travel to Japan to witness current proof-of-concept testing activities and perform a quality surveillance on the laboratory procedures: Foreign trip report, February 6–16, 1992.** Noble, J.J.; Kelly, J.W. Westinghouse Hanford Co., Richland, WA (United States). 16 Mar 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014810. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In November 1991, Kaiser Engineers Hanford Company (KEH) awarded contract KEH-5232 (C-018H) to JGC Corporation of Tokyo, Japan, for the design and construction of the Effluent Treatment Facility (ETF), Project C-018H. The contractor's schedule for Basic Engineering (30%) indicated all basic engineering, Proof of Concept testing and development of the process would be performed in their Yokohama and Oarai, Japan, facilities during the period January through April, 1992. The C-018H Integrated Management Team (IMT) determined that it was necessary to perform a progress assessment of the Basic Engineering and Proof of Concept Testing in February 1992, to assure the design and testing were proceeding according to schedule and within the parameters of the contract specification. In addition, and in support of this assessment, a Quality surveillance was planned.

33758 (DOE/FTR–93015191) **The international operation workshop for the tropical oceans-global atmosphere coupled ocean-atmosphere response experiment in Australia: Foreign trip report, March 6–17, 1993.** Renne, D.S. National Renewable Energy Lab., Golden, CO (United States). 12 Apr 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93015191. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to participate in the International Operations Workshop for the Tropical Oceans-Global Atmosphere Coupled Ocean-Atmosphere Response Experiment (TOGA COARE) in Townsville, Australia, March 8–13, 1992 (this participation was essential to assure proper coordination between DOE's Atmospheric Radiation Measurement (ARM) Program and TOGA COARE activities); to meet with representatives of the Department of Meteorology, University of Hawaii, on ARM's Tropical Western Pacific activities.

33759 (DOE/FTR–93015193) **Travel to Austria to attend meeting on modelling of radionuclide transfer in terrestrial, aquatic and urban environments: Foreign trip report, February 28–March 13, 1992.** Templeton, W.L. Pacific Northwest Lab., Richland, WA (United States). 7 Apr 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93015193. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this travel was to attend as, (a) Chairman of the Coordinated Research Program (CRP) on the "Validation of Models for the Transfer of Radionuclides in Terrestrial, Aquatic and Urban Environments," (VAMP) from March 2–6, 1992, and as, (b) a participant in the newly formed Rivers Working Group.

33760 (DOE/FTR–93015637) **Travel to Papua New Guinea to shut down the Pilot Radiation Observation Experiment (PROBE): Foreign trip report, May 7–19, 1993.** Renne, D.S. National Renewable Energy Lab., Golden, CO (United States). 17 Jun 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93015637. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Since 1 November, 1992, the DOE Atmospheric Radiation Measurement Program (ARM) has been conducting a campaign-style clouds and radiation measurement experiment, called the Pilot Radiation Observation Experiment (PROBE), in Kavieng, Papua New Guinea. This experiment has been conducted in conjunction with the multi-national Tropical Oceans-Global Atmosphere Coupled Ocean-Atmosphere Response Experiment (TOGA COARE), which ran from 1 November 1992–28 February, 1993. I have worked with Dr. William Clements of Los Alamos National Laboratory (ARM's Tropical Western Pacific Site Program Manager) and Dr. Tool Ackerman of Pennsylvania State University (ARM'S Site Scientist for the Tropical Western Pacific) on this experiment, and provided coordination between ARM's activities and the larger TOGA COARE field study. In Kavieng, PROBE assumed operational responsibility of an Integrated Sounding System (ISS), which was installed in support of TOGA COARE. In a previous trip report, dated 7 December 1992, the installation of PROBE and the ISS was described. A follow-up visit to the site was described in a trip report dated 8 February, 1993. This report describes the visit that George Valero, a graduate student at Penn State University, and I took to the site to shut down the experiment, pack the equipment, and arrange for shipment of the PROBE seacontainer to the US. I also visited with officials of the PNG National Weather Service and Department of Civil Aviation in Port Moresby, whose assistance in this experiment was extremely helpful. As part of our planning for ARM's future work in the Tropical Western Pacific, I visited the solar radiation laboratory of the Bureau of Meteorology in Melbourne on my return to the US.

33761 (DOE/FTR–93017254) **Travel to France for meeting on cloud and radiation budget studies: Foreign trip report, May 8–15, 1992.** Spaeth, W.T. Jr. Battelle Washington Operations, DC (United States). 15 Jun 1992. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017254. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of the travel was to represent and present a status report on the Department of Energy's (DOE) Atmospheric Radiation Measurement (ARM) program, and in particular, the ARM Data Management System, to the Ninth Session of the International Satellite Cloud Climatology Program (ISCCP) Working Group on Data Management. The Agenda for the Meeting is included.

33762 (DOE/FTR–93017327) **Travel to Papua New Guinea to apprise weather officials of planned activities of the Pilot Radiation Observation Experiment (PROBE): Foreign trip report, May 1–10, 1992.** Renne, D.S. National Renewable Energy Lab., Golden, CO (United States). 26 May 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93017327. Source: OSTI; NTIS (US Sales Only); GPO Dep.

TOGA COARE will be conducted in the Tropical Western Pacific Ocean near Papua New Guinea and the Solomon Islands from November 1992 through February 1993. During this time, the DOE Atmospheric Radiation Measurement Program (ARM) will conduct a campaign-style radiation measurement experiment, called the Pilot Radiation Observation Experiment (PROBE). I work with Dr. William Clements of Los Alamos National Laboratory (ARM's Tropical Western Pacific Site Program Manager) and Dr. Tom Ackerman of Pennsylvania State University (ARM'S Site Scientist for the Tropical Western Pacific) on this experiment, and provide coordination between ARM's activities and the larger TOGA COARE activity. Specifically, PROBE plans to assume the operation of an Integrated Sounding System (ISS), to be installed at Kavieng, New Ireland Province, in Papua New Guinea (PNG). PROBE will enhance the radiation measurements obtained by the Integrated Sounding System, and install other radiometric and cloud remote sensing equipment at the site. A visit to the site prior to the actual experiment was necessary to make final logistical arrangements for the equipment and personnel involved in the ISS and PROBE. The visit was timed to be coordinated with a visit by personnel from that National Oceanic and Atmospheric Administration (NOAA) and the National Center for Atmospheric Research (NCAR) involved in the design and installation of the ISS. In addition, we were joined by Dr. Joerg Hacker of Flinders University, Australia, who will base

a Cessna 340 research aircraft at Kavieng during TOGA COARE, and by representatives of the PNG Weather Service. Prior to the site visit, Dr. Hacker and I met with the head of the PNG Weather Service in Boroko. Following the site visit, I travelled to Manus Island to observe the operation of an ISS that had just been installed there by the NOAA and NCAR team.

33763 (DOE/MC/29116–3406) **Novel mass spectrometric instrument for gaseous and particulate characterization and monitoring: Technical progress report, January 1, 1993–March 31, 1993.** Coggiola, M.J. SRI International, Menlo Park, CA (United States). Apr 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29116. Order Number DE93019992. Source: OSTI; NTIS; INIS; GPO Dep.

Under contract DE-AC21-92MC29116, SRI International will develop a unique new instrument that will be capable of providing real-time (<I minute), quantitative, chemical characterization of gaseous and particulate pollutants generated from DOE waste cleanup activities. The instrument will be capable of detecting and identifying volatile organic compounds, polynuclear aromatic hydrocarbons, heavy metals, and transuranic species released during waste cleanup activities. The instrument will be unique in its ability to detect and quantify in real-time these diverse pollutants in both vapor and particulate form. The instrument to be developed under this program will consist of several major components: (1) an isokinetic sampler capable of operating over a wide range of temperatures (up to 500 K) and flow rates; (2) a high pressure to low pressure transition and sampling region that efficiently separates particles from vapor-phase components for separate, parallel analyses; (3) two small mass spectrometers, one optimized for organic analysis using a unique field ionization source and one optimized for particulate characterization using thermal pyrolysis and electron-impact ionization (EI); and (4) a powerful personal computer for control and data acquisition.

33764 (DOE/PC/88858–T11) **[Surface study of absorbents for the removal of SO_x and NO_x]: Quarterly report, June 1, 1990–August 31, 1990.** Cooper, B.R.; Montano, P. West Virginia Univ., Morgantown, WV (United States). Dept. of Physics. [1990]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88858. Order Number DE93019440. Source: OSTI; NTIS; GPO Dep.

XANES and EXAFS measurements were made on a CuO/Al_2O_3 sample which went through a complete reaction cycle with flue gases, followed by comparison with pure CuO. In the modeling studies, of the possible bridging type adsorption configurations for the SO_2 molecule on CuO/Al_2O_3, the only one yielding SO_2 adsorption of possible practical interest is that for the SO_2 molecule bridging a Cu and an Al atom with the molecule bent away from the surface; the bonding energy is 1.66 eV.

33765 (DOE/PC/88858–T12) **[Surface study of absorbents for the removal of SO_x and NO_x]: Quarterly report, September 1, 1990–November 30, 1990.** Cooper, B.R.; Montano, P. West Virginia Univ., Morgantown, WV (United States). Dept. of Physics. [1990]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88858. Order Number DE93019400. Source: OSTI; NTIS; GPO Dep.

XANES spectra are given for a number of model sulfur-containing compounds. The XANES and EXAFS spectra and structures of the inorganic standards ($CuSO_4$, FeS_2, FeS, CuS) are discussed. Calculations were made on SO_2 adsorption on CuO/Al_2O_3 surface; results show that the SO_2 is adsorbed on the surface via O-Cu bonding, probably in the form of a "bridge" with the two oxygen atoms of SO_2sitting at two surface metal atoms. It is probably better to have low-temperature adsorption in reusable adsorbents because of the lower bonding energy of the O-Cu bonding. The possibility of adsorption at the edge or corner of the material is considered.

33766 (EML–556) **Semi-annual report of the Department of Energy, Office of Environmental Restoration and Waste Management, Quality Assessment Program.** Sanderson, C.G.; Klusek, C.S. Department of Energy, New York, NY (United States). Environmental Measurements Lab. 1 Jul 1993. 170p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93019732. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assessment Program (QAP) is designed to test the quality of the environmental measurements being reported to the Department of Energy by its contractors. Since 1976, real or synthetic environmental samples that have been prepared and thoroughly analyzed at the Environmental Measurements Laboratory (EML) have been distributed at first quarterly and then semi-annually to these contractors. Their results, which are returned to EML within 90 days, are compiled with EML's results and are reported back to the participating contractors 30 days later. A summary of the reported results is available to the participants 3 days after the reporting deadline via a modem-telephone connection to the EML computer. This report presents the results from the analysis of the 38th set of environmental quality assessment samples (QAP XXXVIII) that were received on or before June 2, 1993.

33767 (ENEA-RT-NUCL–92-01) **X-ray fluorescence for heavy metals determination in suspended particulate samples: Feasibility study.** Aparo, M. (ENEA, Casaccia (Italy). Area Nucleare); Zeppa, P.; Lombardi, V.; Ferrandino, G.; Schirippa Spagnolo, G. May 1992. 54p. (In Italian). (RT/NUCL–92-01). Order Number DE93522944. Source: OSTI; NTIS (US Sales Only).

The activities described in this report were carried out in the framework of the collaboration contract between ENEA (Italian Agency for Energy, New Technologies and the Environment) (COMB-MEPIS Division) and ELECOS S.p.A. The aim of this work was to carry out a feasibility study on the use of the X-ray fluorescence technique for the determination of the air dispersed lead particles collected on a microporous filter. Measurement instrument set-up, relying on either a solid state detector or proportional counter, were considered and a measuring head using an Am^241 radioisotopic source was designed.

33768 (INIS-JP–008, pp. 492-495) **Environmental monitoring of molecular tritium.** Ichimasa, M. (Ibaraki Univ., Mito (Japan). Faculty of Science); Ichimasa, Y.; Akita, Y.; Suzuki, M.; Obayashi, H.; Sakuma, Y. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

The oxidation of atmospheric molecular tritium (HT) in vegetation was determined by in vitro experiments for various kinds of woody and herbaceous plant leaves, mosses and lichens taken from a forest and a garden in Ibaraki prefecture and a forest in Gifu prefecture, and comparison of the HT oxidation activity in vegetation was made with those in its neighboring surface soil (0-5cm in depth). The oxidation of HT in woody plant leaves was extremely low, only about 1/10000-1/1000 that in the surface soil as well as herbaceous plant leaves with some exception, whereas HT oxidation in mosses and lichens was 50-500 times that in pine needles. These results suggest the usefulness of mosses and lichens as monitor vegetation for accidental release of HT into the environment. (author).

33769 (LA–12571-C) **Proceedings for air quality management programs: A workshop on lessons learned.** Streit, G.E. (comp.). Los Alamos National Lab., NM (United States). Jun 1993. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9110496–: Air quality management programs: a workshop on lessons learned, Morelos (Mexico), 16-19 Oct 1991). Order Number DE93015865. Source: OSTI; NTIS; INIS; GPO Dep.

The coordinators of this project at Los Alamos National Laboratory and the Instituto Mexicano del Petroleo proposed a workshop to bring together an international group of experts to present both the lessons of history and the current practices in air quality management around the world. The workshop would also serve as a forum for presenting the accomplishments and plans of this project and for receiving comments from the assembled group. The workshop was favored with an outstanding set of speakers who represented a broad spectrum of experience. Their papers are presented in this volume. The total attendance was forty-four (see List

of Participants) with representation from numerous interested Mexican institutions. Individual reports are processed separately for the database.

33770 (LA-UR–93-1815) **Direct Monte Carlo simulation of the chemical equilibrium composition of detonation products.** Shaw, M.S. Los Alamos National Lab., NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–13: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93014559. Source: OSTI; NTIS; GPO Dep.

A new Monte Carlo simulation method has been developed by the author which gives the equilibrium chemical composition of a molecular fluid directly. The usual NPT ensemble (isothermal-isobaric) is implemented with N being the number of atoms instead of molecules. Changes in chemical composition are treated as correlated spatial moves of atoms. Given the interaction potentials between molecular products, "exact" EOS points including the equilibrium chemical composition can be determined from the simulations. This method is applied to detonation products at conditions in the region near the Chapman- Jouget state. For the example of NO, it is shown that the CJ detonation velocity can be determined to a few meters per second. A rather small change in cross potentials is shown to shift the chemical equilibrium and the CJ conditions significantly.

33771 (LA-UR–93-2921) **Final report of the Mexico City 1991 lidar measurements campaign.** Quick, C.R. Jr.; Archuleta, F.L.; Hof, D.E.; Karl, R.R. Jr.; Tiee, J.J.; Eichinger, W.E.; Holtkamp, D.B.; Tellier, L.L. Los Alamos National Lab., NM (United States). [1993]. 171p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93019960. Source: OSTI; NTIS; GPO Dep.

Over the last two decades, Mexico City, like many large industrial and populous urban areas, has developed a serious air pollution problem, especially during the winter months when there are frequent temperature inversions and weak winds. The deterioration in air quality is the result of several factors. The basin within which Mexico City lies is Mexico's center of political, administrative and economic activity, generating 34% of the cross domestic product and 42% of the industrial revenue, and supporting a population which is rapidly approaching the 20 minion mark. The basin is surrounded by mountains on three sides which inhibit rapid dispersal of pollutants. Emissions from the transportation fleet (more than 3 million vehicles) are one of the primary pollution sources, and are mostly uncontrolled. Catalytic converters are just now being introduced into the fleet. The Mexico City Air Quality Research Initiative is an international collaborative project between the Los Alamos National Laboratory and the Mexican Petroleum Institute dedicated to the investigation of the air quality problem in Mexico City. The main objective of the project is to identify and assess the cost and benefits of major options being proposed to improve the air quality.

33772 (LBL–33442) **Indoor Environment Program: 1992 Annual Report.** Daisey, J.M. Lawrence Berkeley Lab., CA (United States). Jun 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93018601. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reports progress during the year 1992 in the Indoor Environment Program in the Energy and Environment Division of Lawrence Berkeley Laboratory. Studies in the following areas are reported: energy performance and ventilation in buildings; physical and chemical characterization of indoor air pollutants; indoor radon; indoor air quality; exposure to indoor air pollutants and risk analysis. Pollutants of particular interest include: radon; volatile, semi-volatile and particulate organic compounds; and combustion emissions including environmental tobacco smoke, carbon monoxide, and nitrogen oxides.

33773 (LBL–33445) **Environmental research program: 1992 annual report.** Lawrence Berkeley Lab., CA (United States). Jul 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93019101. Source: OSTI; NTIS; GPO Dep.

The objective of the Environmental Research Program is to contribute to the understanding of the formation, mitigation, transport, transformation, and ecological effects of energy-related pollutants on the environment. The program is multidisciplinary and includes fundamental and applied research in chemistry, physics, biology, engineering, and ecology. The program undertakes research and development in efficient and environmentally benign combustion, pollution abatement and destruction, and novel methods of detection and analysis of criteria and non-criteria pollutants. This diverse group investigates combustion, atmospheric processes, flue-gas chemistry, and ecological systems.

33774 (LBL–34297) **Crossed molecular beam studies of atmospheric chemical reaction dynamics.** Zhang, Jingsong. Lawrence Berkeley Lab., CA (United States). Apr 1993. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93019246. Source: OSTI; NTIS; GPO Dep.

The dynamics of several elementary chemical reactions that are important in atmospheric chemistry are investigated. The reactive scattering of ground state chlorine or bromine atoms with ozone molecules and ground state chlorine atoms with nitrogen dioxide molecules is studied using a crossed molecular beams apparatus with a rotatable mass spectrometer detector. The $Cl + O_3 \rightarrow ClO + O_2$ reaction has been studied at four collision energies ranging from 6 kcal/mole to 32 kcal/mole. The derived product center-of-mass angular and translational energy distributions show that the reaction has a direct reaction mechanism and that there is a strong repulsion on the exit channel. The ClO product is sideways and forward scattered with respect to the Cl atom, and the translational energy release is large. The Cl atom is most likely to attack the terminal oxygen atom of the ozone molecule. The $Br + O_3 \rightarrow ClO + O_2$ reaction has been studied at five collision energies ranging from 5 kcal/mole to 26 kcal/mole. The derived product center-of-mass angular and translational energy distributions are quite similar to those in the $Cl + O_3$ reaction. The $Br + O_3$ reaction has a direct reaction mechanism similar to that of the $Cl + O_3$ reaction. The electronic structure of the ozone molecule seems to play the central role in determining the reaction mechanism in atomic radical reactions with the ozone molecule. The $Cl + NO_2 \rightarrow ClO + NO$ reaction has been studied at three collision energies ranging from 10.6 kcal/mole to 22.4 kcal/mole. The center-of-mass angular distribution has some forward-backward symmetry, and the product translational energy release is quite large. The reaction proceeds through a short-lived complex whose lifetime is less than one rotational period. The experimental results seem to show that the Cl atom mainly attacks the oxygen atom instead of the nitrogen atom of the NO_2 molecule.

33775 (NEI-DK–1264) **Reburning rich-lean kinetics: Annual report 1992.** Glarborg, P. (Department of Chemical Engineering, Technical University of Denmark (Denmark)); Dam-Johansen, K.; Kristensen, P.G. Nordisk Gasteknisk Center, Hoersholm (Denmark). Jun 1993. 14p. Contract GRI-5091-260-2126;Contract NGC-89-03-11. Order Number DE93525254. Source: OSTI; NTIS.

Prepared for Gas Research Institute, Chicago, Illinois, USA.

The report presents the results of the second year of a three year effort to identify optimum conditions for conversion of reactive nitrogen to N_2 at the rich-lean transition in staged combustion. The information gained will be useful for outlining improved staged combustion strategies for control of nitrogen oxides emission. Specifically, the results will be valuable for optimizing natural gas reburning and advanced reburning techniques. The experimental work is conducted in specially designed laminar flow quartz reactors that provide well-defined reaction conditions in the temperature range of interest. During the past year a parametric study of the burnout zone nitrogen chemistry in Natural Gas Reburning has been initiated. The effect of temperature, partitioning of HCN, No and NH_3 in the flue gas, and CO concentration on the conversion of reactive nitrogen has been investigated. Results show that there is a temperature window around 1250 K where both HCN and NH_3 act as reducing agents for NO, yielding a decrease in total fixed nitrogen. Presence of CO and other combustibles move the window towards lower temperatures, below 1000 K at 2% CO. In the temperature window significant amounts of intermediate N_2O is

formed. A preliminary chemical kinetic model involving 35 components and 160 reactions has been established to analyze the results. (AB) (17 refs.)

33776 (NEI-NO–358) **Atmospheric CO_2 and global warming: A critical review.** Jaworowski, Z. (Norsk Polarinstitutt, Oslo (Norway)); Segalstad, T.V.; Hisdal, V. Norsk Polarinstitutt, Oslo (Norway). May 1992. 76p. Order Number DE93525291. Source: OSTI; NTIS.

2. revised ed.

The projections of man-made climate change through burning of fossil carbon fuels (coal, gas, oil) to CO_2 gas are based mainly on interpretations of measured CO_2 concentrations in the atmosphere and in glacier ice. These measurements and interpretations are subject to serious uncertainties. Dominant factors in the Earth's surface CO_2 cycle are the ocean, in addition to mineral equilibria. Due to their vast buffer capacity, they stabilize the geochemical equilibrium of CO_2 gas between the hydro-, atmo-, litho- and biosphere. The 19th century measurements of CO_2 in the atmosphere were carried out with an error of up to 100%. A value of 290 ppmv (parts per million, by volume) was chosen as an average for the 19th century atmosphere, by rejecting "not representative" measured values which differed more than 10% from the "general average for the time". Attempts have been made to calculate the paleoatmospheric CO_2 content from $^{13}C/^{12}C$ carbon stable-isotope ratios in tree rings. It is concluded here that the CO_2 content in the atmosphere calculated from such carbon isotope analyses cannot be considered a valid tool in paleoclimatology, nor can it be used as evidence of changing atmospheric CO_2 levels. The so-called increasing "greenhouse effect" signal, i.e. anthropogenic increase of the global air temperature, which was claimed to have been observed during the last decades, is not confirmed by recent studies of long temperature series. In the Arctic, according to model calculations, this warming should be most pronounced. However, cooling rather than warming has been recorded in this region during the last two decades. Glacier balance studies provide evidence for a recent decrease in glacier retreat, and for an increased accumulation over the polar ice caps, corresponding to a sea level lowering of about 1 mm per year. 255 refs., 10 figs., 2 tabs.

33777 (NUTEK-VK–93-4) **Reduction of nitrogen oxides in exhaust gases from diesel engines in a 5 kW stainless steel CFB-plant.** Wingaard, S. (Chalmers Univ. of Technology, Goeteborg (Sweden). Dept of Energy Conversion); Leckner, B. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden); Chalmers Univ. of Technology, Goeteborg (Sweden). Dept. of Energy Conversion. [1993]. 22p. (In Swedish). Project NUTEK-566-002. (CTH-A–91-196). Order Number DE93795070. Source: OSTI; NTIS.

Experiments to determine the reduction of nitric oxide in diesel exhaust have been performed. The experimental set-up consists of a diesel engine connected to a small circulating fluidized bed (CFB) stainless steel combustor. The riser has a height of 5.6 m and a diameter of 52 mm. A zero test with no bed material and propane as fuel showed high reduction during fuel-rich combustion. This reduction was mainly caused by the catalytic effect of the hot tube walls. Experiments with bed material gave slightly higher reduction. Coal instead of propane as fuel also gave a higher reduction. This was mainly due to high carbon monoxide concentration during coal combustion. The catalytic effect of the wall influenced the experiments severely, so the results from these experiments cannot be applied to a full-scale facility. One important question, therefore, about the char influence of the reduction of nitric oxide, is not answered. (12 refs., 10 figs., 3 tabs.).

33778 (ORNL/M–2936) **The urban perspectives of acid rain: Workshop summary.** Tonn, B.E. Oak Ridge National Lab., TN (United States). 4 Jun 1993. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-9209381–Summ.: The urban perspective of acid rain, Raleigh, NC (United States), 23-24 Sep 1992). Order Number DE93018881. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents discussions held during a workshop an Urban Perspective of Acid Rain. The workshop was sponsored by the Office of the Director, National Acid Precipitation Assessment Program (NAPAP). NAPAP anticipates giving increased emphasis to the benefits in urban areas of emissions reductions. The goal of this informal, exploratory workshop was to serve as a first step towards identifying pollutant monitoring, and research and assessment needs to help answer, from an urban perspective, the two key questions posed to NAPAP by Congress: (1) what are the costs, benefits, and effectiveness of the acid rain control program, and (2) what reductions in deposition, rates are needed in order to prevent adverse effects? The workshop addressed research activities needed to respond to these questions. The discussions focused. sequentially, on data needs, data and model availability, and data and modeling gaps. The discussions concentrated on four areas of effects: human health, materials, urban forests, and visibility.

33779 (ORNL/TM–12409) **Characterization of ventilation ductwork in building K-31 at the Oak Ridge K-25 Site.** Klasson, K.T.; Corder, S.L. Oak Ridge National Lab., TN (United States). Aug 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019818. Source: OSTI; NTIS; INIS; GPO Dep.

An extensive sampling and analysis program was initiated in mid-August 1992 to characterize the ductwork of Building K-31 at the Oak Ridge K-25 Site. This building, 15 acres under roof, contains approximately 4,000 ft of main exhaust ducts (plenums), not including the side laterals, which are extensive. A large number of hexane-moistened wipe samples were taken from randomly selected locations within the seven main plenums and the side lateral ducts. Some samples were taken from the air-intake ducts as well. Three wipes were taken from each location and were analyzed for polychlorinated biphenyls (PCBs), uranium, and technetium. These samples were augmented with ten metal coupon samples (cut from the ducts) that were analyzed for radionuclides and subjected to Toxicity Characteristic Leaching Procedure analyses for toxic metals, base/neutral/acid compounds, and volatile organic compounds. Based on the wipe analyses (with 95% confidence), 95% of the contamination levels in the ductwork are as follows. PCB levels are <200, <760, and <96 $\mu g/100$ cm^2 for the main plenums, side lateral ducts, and air-intake ducts respectively; uranium levels are $<1,390$, $<8,430$, and <340 $\mu g/100$ cm^2 for the main plenums, side lateral ducts, and air-intake ducts respectively; and technetium levels are $<3,130$, $<167,000$, and $<2,570$ pCi/100 cm^2 for the main plenums, side lateral ducts, and air-intake ducts respectively. These values are higher than the contamination limits for the respective contaminants.

33780 (PNL–8744) **Pantex Plant meteorological monitoring program.** Snyder, S.F. Pacific Northwest Lab., Richland, WA (United States). Jul 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93018495. Source: OSTI; NTIS; INIS; GPO Dep.

The current meteorological monitoring program of the US Department of Energy's Pantex Plant, Amarillo, Texas, is described in detail. Instrumentation, meteorological data collection and management, and program management are reviewed. In addition, primary contacts are noted for instrumentation, calibration, data processing, and alternative databases. The quality assurance steps implemented during each portion of the meteorological monitoring program are also indicated.

33781 (PNL-SA–22658) **The carbon dioxide emissions game: Playing the net.** Richards, K.R.; Edmonds, J.A.; Rosenthal, D.H.; Wise, M. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9306214–1: Carbon sinks workshop for the interagency national action plan development process, Washington, DC (United States), 10-11 Jun 1993). Order Number DE93017670. Source: OSTI; NTIS; GPO Dep.

Concern about rising concentrations of carbon dioxide in the earth's atmosphere has led to calls for the United States and other countries to reduce carbon emissions. These concerns resulted in the signing of the Framework Convention on Climate Change at the United Nations Conference on the Environment and Development in Rio de Janeiro in June 1992. The Framework calls for nations to develop action plans for limiting emissions of carbon and other greenhouse gases. In December 1992, in accordance with the Framework, the US Government released for public comment

its National Action Plan for Global Climate Change (US Department of State, 1992). The Action Plan detailed steps for reducing carbon emissions by 93 to 130 million metric tons (MMT) by 2000. Some of the steps included in the Action Plan were reforming regulations, setting energy standards, promoting research and development of new energy technologies, expanding the use of alternative-fueled vehicles, and planting trees to sequester carbon. This paper explores the economic implications of implementing a much larger tree-planting program than the one presented in the Action Plan. Whereas the Action Plan estimated that 5 to 9 MMT of carbon (MMTC) could be sequestered in 2000 (with perhaps threefold increases in sequestration in later years when trees are growing the fastest), the program being considered in this analysis annually sequesters as much as 231 MMTC during its peak years. Our analysis focuses on how much the costs of stabilizing US carbon emissions at 1990 levels are reduced when economic criteria alone determine the number of trees that will be used. Our results show that when the focus is shifted from stabilization of gross emissions to net emissions the cost reductions are dramatic, about 20 to 80 percent depending on the assumed cost of trees. Political and institutional obstacles to the formation of such a cost effective response are explored in the conclusions.

33782 (PPL–2923) **Removing CFC's from the atmosphere with lasers – a second look.** Stix, T.H. Princeton Univ., NJ (United States). Plasma Physics Lab. Jul 1993. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-930652–1: 20. IEEE international conference on plasma sciences, Vancouver (Canada), 7-9 Jun 1993). Order Number DE93017516. Source: OSTI; NTIS; INIS; GPO Dep.

An option to both mitigate greenhouse warming and to help preserve the ozone layer could be to remove chlorofluorocarbons (CFC's) from their principal reservoir, the troposphere. But due to the extremely low atmospheric concentration of the CFC's (less than one part per billion by volume), such a process must be enormously selective to be cost-effective. It was suggested in 1989 that vast arrays of extremely powerful infrared lasers might be used to break up tropospheric CFC's via multiphoton dissociation (MPD). Computer calculations making use of an extensive atmospheric-gas infrared cross-section database suggest that – at carefully chosen wavelengths – 90% transmission over 50-kilometer paths would be possible through dry atmospheres. Still, a factor of 10 or 20 greater efficiency for the laser-CFC dissociation process is needed to bring the projected costs down to where the plan would merit serious consideration. The likeliest possibility for improvement appears to be to "chirp" the infrared laser frequency, that is, lowering its frequency during each pulse so as to remain in resonance – as long as possible – with the anharmonic vibrations of the CFC molecules. What is needed is a factor of 10 or more decrease below the laser-beam fluence now thought to be required for CFC infrared multiphoton dissociation. Specifically, one would look to achieve CFC NTD with an infrared fluence of 0.1 to 0.2 joules per cm^2. This goal may not be reachable, but laboratory experiments using presently available apparatus and techniques could explore this intriguing question. Following a summary of present knowledge concerning ozone depletion, this paper discusses the process of multiphoton dissociation and ways, including laser chirping, by which the MPD efficiency might be enhanced.

33783 (SAND–93-1044) **Volatile organic monitor for industrial effluents.** Laguna, G.R.; Peter, F.J.; Stuart, A.D.; Loyola, V.M. Sandia National Labs., Albuquerque, NM (United States). Jul 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018692. Source: OSTI; NTIS; INIS; GPO Dep.

1990 amendments to the Clean Air Act have created the need for instruments capable of monitoring volatile organic compounds (VOCS) in public air space in an unattended and low cost manner. The purpose of the study was to develop and demonstrate the capability to do long term automatic and unattended ambient air monitoring using an inexpensive portable analytic system at a commercial manufacturing plant site. A gas chromatograph system personal computer hardware, meteorology tower & instruments, and custom designed hardware and software were developed. Comparison with an EPA approved method was performed. The system was sited at an aircraft engines manufacturing site and operated in a completely unattended mode for 60 days. Two VOCs were monitored every 30 minutes during the 24hr day. Large variation in the concentration from 800ppb to the limits of detection of about 10ppb were observed. Work to increase the capabilities of the system is ongoing.

33784 (SAND–93-7031) **Effects of the Mount Pinatubo eruption on solar insolation: Four case studies.** Rosenthal, A.L. (New Mexico State Univ., Las Cruces, NM (United States). Southwest Technology Development Inst.); Robert, J.M. Sandia National Labs., Albuquerque, NM (United States); New Mexico State Univ., Las Cruces, NM (United States). Southwest Technology Development Inst. May 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018454. Source: OSTI; NTIS; GPO Dep.

The Southwest Technology Development Institute staff analyzed solar insolation data from four sites recorded during the years 1990 through 1992. Analyses were performed to identify and quantify the effects on insolation caused by the eruption of Mount Pinatubo in the Philippines on June 15th and 16th, 1991. The four monitoring stations that supplied the raw data for this report were: The Southwest Region Experiment Station in Las Cruces, New Mexico; The Solar Radiation Research Laboratory at the National Renewable Energy Laboratory in Golden, Colorado; The Solar Insolation Monitor Program station operated by the Pacific Gas and Electric Company in Carrisa Plains, California; and The Solar Insolation monitor station at Sandia National Laboratories in Albuquerque, New Mexico. Data from each of the sites were recorded by dedicated datalogging equipment. Every effort was made to prevent data acquisition system problems (e.g., drift of the datalogger clock) from influencing the accuracy of the results.

33785 (SAND–93-8011) **Environmental Monitoring Plan.** Holland, R.C. (Science Applications International Corp., San Diego, CA (United States)). Sandia National Labs., Livermore, CA (United States). Jul 1993. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018697. Source: OSTI; NTIS; INIS; GPO Dep.

This Environmental Monitoring Plan was written to fulfill the requirements of Department of Energy (DOE) Order 5400.1 and DOE Environmental Regulatory Guide DOE/EH 0173T. This Plan documents the background, organizational structure, and methods used for effluent monitoring and environmental surveillance at Sandia National Laboratories/California. The design, rationale, and historical results of the environmental monitoring system are discussed in detail. Throughout the Plan, recommendations for improvements to the monitoring system are made. This revision to the Environmental Monitoring Plan was written to document the changes made to the Monitoring Program during 1992. Some of the data (most notably the statistical analyses of past monitoring data) has not been changed.

33786 (UCRL-ID–110618) **Engineering Assessment and Certification of Integrity of the 490-Q1 tank system.** Schwartz, W.W. (Lawrence Livermore National Lab., CA (United States)); Gee, C.W.; Graser, D.A. Lawrence Livermore National Lab., CA (United States). Jul 1993. 171p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019551. Source: OSTI; NTIS; GPO Dep.

This Engineering Assessment and Certification of Integrity of used freon storage tanks 490-Q1A1 and 490-Q1A2 has been prepared in response to 40 CFR 265.192(a) and 22 CCR 66265.192(a) for new tank systems that store hazardous waste and have secondary containment. The regulations require that this assessment be completed and certified by an independent, qualified, California-registered professional engineer before the tank system is placed in use as a hazardous waste storage tank system. The technical assessments for the 490-Q1A1 and 490-Q1A2 tank systems have been reviewed by an independent, qualified, California-registered professional engineer, who has certified that the tank systems have sufficient structural integrity, are acceptable for transferring and storing hazardous waste, are compatible with the stored waste, and the tanks and containment system are suitably designed to achieve the requirements of the applicable regulations so they will not collapse, rupture, or fail.

33787 (UCRL-ID–113761) **Moments of ambient Doppler spectra.** Lehman, S.K. Lawrence Livermore National Lab., CA (United States). 23 Mar 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93017948. Source: OSTI; NTIS; GPO Dep.

The author studied the first four moments (center of mass, standard deviation, skew, and kurtosis) of the Doppler spectra in ambient regions of LLNL-Hughes real aperture radar data collected during WCSEX91–92. The goal was to correlate trends in the moments with wind velocity and direction. Although the center of mass appears to increase when the wind is blowing into the radar antenna, no other conclusions have been drawn from the higher order moments.

33788 (UCRL-ID–114054) **Inclusion of a three-dimensional washout coefficient in ADPIC.** Naeslund, E.; Holmstroem, H. Lawrence Livermore National Lab., CA (United States). May 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018499. Source: OSTI; NTIS; INIS; GPO Dep.

In ADPIC, the deposition emerging from washout has thus far been modelled rather crudely, since the only option has been to turn the rain on and off at different times. This kind of modelling is particularly unsatisfactory when ADPIC is used to model continuous releases over long periods of time. The assumption of simultaneous rain throughout such a large plume is simply not true. In this report a modified version of ADPIC with a three-dimensional (3-D) washout coefficient is presented. The effect of space variable precipitation is examined via two separate releases that are simulated for a period of 48 hours: one continuous 'Chernobyl-like source' release and one instantaneous 'nuclear explosion-like'. Simulations with both the new and old formulation are made and the resulting deposition patterns are compared.

33789 (UCRL-JC–113039) **Toward a high performance distributed memory climate model.** Wehner, M.F. (Lawrence Livermore National Lab., CA (United States)); Ambrosiano, J.J.; Brown, J.C.; Dannevik, W.P.; Eltgroth, P.G.; Mirin, A.A.; Farrara, J.D.; Ma, C.C.; Mechoso, C.R.; Spahr, J.A. Lawrence Livermore National Lab., CA (United States). 15 Feb 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9307111–2: 2. international symposium on high-performance distributed computing, Spokane, WA (United States), 20-23 Jul 1993). Order Number DE93019156. Source: OSTI; NTIS; GPO Dep.

As part of a long range plan to develop a comprehensive climate systems modeling capability, the authors have taken the Atmospheric General Circulation Model originally developed by Arakawa and collaborators at UCLA and have recast it in a portable, parallel form. The code uses an explicit time-advance procedure on a staggered three-dimensional Eulerian mesh. The authors have implemented a two-dimensional latitude/longitude domain decomposition message passing strategy. Both dynamic memory management and interprocessor communication are handled with macro constructs that are preprocessed prior to compilation. The code can be moved about a variety of platforms, including massively parallel processors, workstation clusters, and vector processors, with a mere change of three parameters. Performance on the various platforms as well as issues associated with coupling different models for major components of the climate system are discussed.

33790 (UCRL-JC–114013) **Modeling and measurements of nocturnal drainage flows along the Front Range of the Rocky Mountains.** Leone, J.M. Jr.; Gudiksen, P.H. Lawrence Livermore National Lab., CA (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930810–4: Topical meeting on environmental transport and dosimetry, Charleston, SC (United States), 31 Aug - 3 sep 1993). Order Number DE93016527. Source: OSTI; NTIS; GPO Dep.

In support of the DOE ASCOT program Lawrence Livermore National Laboratory has analyzed the wind, temperature, and net radiation measurements acquired by the network of sensors situated within and outside the Coal Creek Canyon drainage area during 1991. It is shown that strong cooling rates, between 50–80 W/m^2, generate will defined drainage flows with a maximum speed of approximately 6 m/s. A cooling rate of 15–30 W/m^2, produces a significantly weaker drainage flow and further reduction of the cooling rate results in the failure of any significant drainage flows to form. In an attempt to further understand these flows researchers conducted numerical simulations of two representative flows.

33791 (UCRL-JC–114098) **Application of an atmospheric dispersion model to simulated pollutant releases in the Colorado Front range.** Lange, R. Lawrence Livermore National Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930810–5: Topical meeting on environmental transport and dosimetry, Charleston, SC (United States), 31 Aug - 3 sep 1993). Order Number DE93017118. Source: OSTI; NTIS; GPO Dep.

The 1991 ASCOT (Atmospheric Studies in Complex Terrain) field study in the vicinity of the Department of Energy's Rocky Flats Plant, Colorado, was conducted to study the local and regional circulations and their interactions with synoptic flows over the complex terrain of the Rocky Mountains Colorado Front range. The study was combined with the Rocky Flats Winter validation Study (WVS) which had similar objectives. Tracer plumes were released as part of this field campaign over the period of February 3–19, 1991 from the Rocky Flats Plant. Twelve intensive experiments, centered around eleven-hour long surface releases of sulfur hexafloride (SF_6)tracer material, were conducted by teams from a number of national laboratories, government agencies and private contractors. One-hourly averaged tracer concentrations were collected from approximately 170 surface samplers deployed along two concentric circles at a radius of 8 km and 16 km from the release location. The concentration patterns resulting from the transport and turbulent diffusion of the SF_6 traces plumes within the atmospheric boundary layer during two night-time, one morning transition, and one day-time period were simulated for this paper. The scenarios selected represent the first-choice of all twelve experiments to be addressed, based on the quality and completeness of the collected data base and the presence of the desired meteorological conditions.

33792 (UCRL-JC–114930) **A real-time monitoring/emergency response modeling workstation for a tritium facility.** Lawver, B.S. (Lawrence Livermore National Lab., CA (United States)); Sims, J.M.; Baskett, R.L. Lawrence Livermore National Lab., CA (United States); EG and G Energy Measurements, Inc., Pleasanton, CA (United States). Jul 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC08-88NV10617. (CONF-931160–15: American Nuclear Society (ANS) winter meeting, San Francisco, CA (United States), 14-19 Nov 1993). Order Number DE93018630. Source: OSTI; NTIS; INIS; GPO Dep.

At Lawrence Livermore National Laboratory (LLNL) we developed a real-time system to monitor two stacks on our tritium handling facility. The monitors transmit the stack data to a workstation which computes a 3D numerical model of atmospheric dispersion. The workstation also collects surface and upper air data from meteorological towers and a sodar. The complex meteorological and terrain setting in the Livermore Valley demands more sophisticated resolution of the three-dimensional structure of the atmosphere to reliably calculate plume dispersion than afforded by Gaussian models. We experience both mountain valley and sea breeze flows. To address these complexities, we have implemented the three-dimensional diagnostic MATHEW mass-adjusted wind field and ADPIC particle-in-cell dispersion models on the workstation for use in real-time emergency response modeling. Both MATHEW and ADPIC have shown their utility in a variety of complex settings over the last 15 years within the Department of Energy's Atmospheric Release Advisory Capability (ARAC[1,2]) project.

33793 (WSRC-MS–93-326) **Environmental ALARA Program at the Savannah River Site.** Jannik, G.T. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9307103–4: 11. international system safety conference, Cincinnati, OH (United States), 28 Jul - 2 aug 1993). Order Number DE93018193. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Site (SRS) follows the ALARA (As Low As Reasonably Achievable) philosophy of keeping radiation doses to the general public as low as practical by minimizing radioactive releases to the environment. SRS accomplishes this goal by establishing challenging sitewide and area-specific Environmental ALARA Release Guides and trending radioactive releases against these guides on a monthly basis. The SRS Environmental ALARA Program, mandated by DOE Order 5400.5, is a dose-based program that has gone through many changes and improvements in recent years. A description of the SRS Environmental ALARA Program and its performance is presented in this paper. Recent SRS studies of the "Zero Release" option also are described.

33794 (ANL–93/13) **ANL technical support program for DOE Environmental Restoration and Waste Management: Annual report, October 1991–September 1992.** Bates, J.K. (Argonne National Lab., IL (US)); Bradley, C.R.; Buck, E.C.; Cunnane, J.C.; Dietz, N.L.; Ebert, W.L.; Emery, J.W.; Feng, X.; Gerding, T.J.; Gong, M.; Hoh, J.C.; Mazer, J.J.; Wronkiewicz, D.J.; Bourcier, W.L.; Morgan, L.E.; Newton, L.; Nielsen,.Argonne National Lab., IL (United States). May 1993. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93018116. Source: OSTI; NTIS; INIS; GPO Dep.

A program was established for DOE Environmental Restoration and Waste Management (EM) to evaluate factors that are anticipated to affect waste glass reaction during repository disposal, especially in an unsaturated environment typical of what may be expected for the proposed Yucca Mountain repository site. This report covers progress in FY 1992 on the following tasks: 1. A compendium of the characteristics of high-level nuclear waste borosilicate glass has been written. 2. A critical review of important parameters that affect the reactivity of glass in an unsaturated environment is being prepared. 3. A series of tests has been started to evaluate the reactivity of fully radioactive glasses in a high-level waste repository environment and compare it to the reactivity of synthetic, nonradioactive glasses of similar composition. 4. The effect of radiation upon the durability of waste glasses at a high glass surface area-to-liquid volume (SA/V) ratio and a high gas-to-liquid volume ratio will be assessed. These tests address both vapor and high SA/V liquid conditions. 5. A series of tests is being performed to compare the extent of reaction of nuclear waste glasses at various SAN ratios. Such differences in the SAN ratio may significantly affect glass durability. 6. A series of natural analogue tests is being analyzed to demonstrate a meaningful relationship between experimental and natural alteration conditions. 7. Analytical electron microscopy (AEM), infrared spectroscopys and nuclear resonant profiling are being used to assess the glass/water reaction pathway by identifying intermediate phases that appear on the reacting glass. Additionally, colloids from the leach solutions are being studied using AEM. 8. A technical review of AEM results is being provided. 9. A study of water diffusion involving nuclear waste glasses is being performed. 10. A mechanistically based model is being developed to predict the performance of glass over repository-relevant time periods.

33795 (ANL/ER/CP–79013) **Development of technology performance specifications for volatile organic compounds.** Purdy, C. (Dept. of Energy, Germantown, MD (US). Office of Environmental and Waste Management); Schutte, W.E.; Erickson, M.D.; Carpenter, S.C.; Doskey, P.V.; Lindahl, P.C.; Pflug, A.D. Argonne National Lab., IL (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9307101–2: 9. annual waste testing and quality assurance symposium, Arlington, VA (United States), 12-16 Jul 1993). Order Number DE93017705. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Technology Development (OTD) within the Office of Environmental Restoration and Waste Management of the Department of Energy has a mission to deliver needed and usable technologies to its customers. The primary customers are individuals and organizations performing environmental characterization and remediation, waste cleanup, and pollution prevention at DOE sites. DOE faces a monumental task in cleaning up the dozen or so major sites and hundreds of smaller sites that were or are used to produce the US nuclear weapons arsenal and to develop nuclear technologies for national defense and for peaceful purposes. Contaminants and waste materials include the radionuclides associated with nuclear weapons, such as plutonium and tritium, and more common pollutants and wastes of industrial activity such as chromium, chlorinated solvents, and polychlorinated biphenyls (PCBs). Quite frequently hazardous wastes regulated by the Environmental Protection Agency are co-mingled with radioactive wastes regulated by the Nuclear Regulatory Commission to yield a "mixed waste," which increases the cleanup challenges from several perspectives. To help OTD and its investigators meet DOE's cleanup goal, technology performance specifications are being implemented for research and development and DT&E projects. Technology performance specifications or "performance goals" describe, quantitatively where possible, the technology development needs being addressed. These specifications are used to establish milestones, evaluate the status of ongoing projects, and determine the success of completed projects.

33796 (ANL/ESD/TM–50) **Videographic enhancement of GRASS imagery: Recent advances.** Sullivan, R.G. Argonne National Lab., IL (United States). Jun 1992. 39p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93018871. Source: OSTI; NTIS; GPO Dep.

The Geographic Resource Analysis Support System (GRASS), a geographic information system, has been fielded at approximately 50 US Army training installations as a land-management decision-making tool. Use of the GRASS geographic information system involves the production of numerous digital maps of environmental parameters, such as elevation, soils, hydrography, etc. A recently emerging technology called computer videographics can be used to graphically enhance GRASS images, thereby creating new ways to visualize GRASS analysis results. The project described in this report explored the enhancement of GRASS images through the use of videographic technology. General image quality of videographically enhanced GRASS images was improved through the use of high-resolution imagery and improved software. Several new types of geographic data visualizations were developed, including three-dimensional shaded-relief maps of GRASS data, overlay of GRASS images with satellite images, and integration of computer-aided-design imagery with GRASS images. GRASS images were successfully enhanced using Macintosh hardware and software, rather than the DOS-based equipment used previously. Images scanned with a document scanner were incorporated into GRASS imagery, and enhanced images were output in an S-VHS high-resolution video format.

33797 (ANL/ESD/TM–51) **Geophysical study of the Building 103 Dump, Aberdeen Proving Ground.** McGinnis, L.D.; Miller, S.F.; Thompson, M.D.; McGinnis, M.G. Argonne National Lab., IL (United States). Dec 1992. 41p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93019857. Source: OSTI; NTIS; GPO Dep.

The Building 103 Dump is one of ten potentially contaminated sites in the Canal Creek and Westwood areas of the Edgewood section of Aberdeen Proving Ground examined by a geophysical team from Argonne National Laboratory in April and May of 1992. Noninvasive geophysical surveys, including magnetics, resistivity, ground-penetrating radar, and seismic refraction, were conducted. These surveys indicate that much of the area is free of debris.

However, prominent magnetic and resistivity anomalies occur along well-defined lineaments, suggestive of a dendritic stream pattern. Prior to the onset of dumping, the site was described as a "sand pit," which suggests that headward erosion of Canal Creek tributaries cut into the surficial aquifer. Contaminants dumped into the landfill would have direct access to the surficial aquifer and thus to Canal Creek. Seismic refraction profiling indicates 6–12 ft of fill material now rests on the former land surface. Only the northern third of the former landfill was geophysically surveyed.

33798 (BNL–48749) **Regulatory issues and assumptions associated with barriers in the vadose zone surrounding buried waste.** Siskind, B.; Heiser, J. Brookhaven National Lab., Upton, NY (United States). Feb 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93019471. Source: OSTI; NTIS; INIS; GPO Dep.

One of the options for control of contaminant migration from buried waste sites is the construction of a subsurface barrier that consists of a wall of low permeability material. The barrier material should be compatible with soil and waste conditions specific to the site and have as low an effective diffusivity as is reasonably achievable to minimize or inhibit transport of moisture and contaminants. This report addresses the regulatory issues associated with the use of non-traditional organic polymer barriers as well as the use of soil-bentonite or cement-bentonite mixtures for such barriers, considering barriers constructed from these latter materials to be a regulatory baseline. The regulatory issues fall into two categories. The first category consists of issues associated with the acceptability of such barriers to the EPA as a method for achieving site or performanceimprovement. The second category encompasses those regulatory issues concerning health, safety and the environment which must be addressed regarding barrier installation and performance, especially if non-traditional materials are to be used.

33799 (BNL–49162) **National radiation exposures and risks caused by implementing EPA's proposed revised national primary drinking water regulations.** Morris, S.C.; Rowe, M.D.; Holtzman, S.; Meinhold, A.F. Brookhaven National Lab., Upton, NY (United States). May 1993. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93018384. Source: OSTI; NTIS; INIS; GPO Dep.

This report estimates risks to workers and the public associated with treatment processes and their associated waste products that would be mandated under proposed regulations of radium, radon, and uranium in drinking water. Three scenarios were examined: (1) all wastes flushed to the sanitary sewer; (2) all wastes disposed on land; (3) similar to (2) but radon removal by granulated activated carbon rather than packed tower aeration. Risks considered included accidental injury and cancer. Worker risks for both scenarios I and II were estimated to be 0.025 and 0.01 deaths per year of operation for radium-226 and radium-228, respectively. Worker risks for uranium were estimated to be 0.13 deaths/year of operation for scenario I and 0.5 deaths/year of operation for scenario II. Worker risks for radon removal were estimated to be 1.7 deaths/year of operation for scenario I and 2.2 deaths/year of operation for scenario II. Risks to the public for scenarios I and II for radium-226 were 4×10^{-4} and for radium-228 were 9×10^{-5} deaths/year of operation. Risks to the public for scenarios I and II for uranium were 7.3×10^{-2} and 2×10^{-4}, respectively. Risks to the public for scenario I and II for radon were 24 deaths/year of operation and for scenario III were nil. Public risks were quantified only for people exposed during a year of operation. For example, effects of public exposures in future years via groundwater contamination associated with landfill of treatment waste were not considered.

33800 (BNL–70331) **Biological research in Wales and England: Foreign trip report, March 22–April 1, 1993.** Long, S.P. Brookhaven National Lab., Upton, NY (United States). 22 Apr 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93014310. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to present findings of biological research conducted within the Brookhaven National Laboratory. FACE system in invited lectures to two European research conferences, and specifically to present our findings on the acclimatization of wheat photosynthesis to elevated CO_2 concentrations. To inform audiences, from a biological perspective, the potential advantages of the FACE approach to advancing understanding of the impact of rising CO_2 concentrations on vegetation. To obtain information on British and EEC initiatives in research on the effects of rising CO_2 concentrations on vegetation and in particular photosynthesis. To obtain information on new DNA probes for genes of key enzymes of photosynthesis and carbohydrate metabolism that might be of value in the current USDA/BNL FACE-Wheat experiment, and subsequent FACE experiments. To meet with staff from ETH, Zurich, to discuss my possible involvement with the Swiss-FACE experiment.

33801 (DOE/FTR–93014867) **Travel to Europe for research in INTRAVAL; modelling brine inflow and groundwater flow at WIPP: Foreign trip report, March 27–April 3, 1993.** Gorham, E.D. Sandia National Labs., Albuquerque, NM (United States). 3 Jun 1993. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93014867. Source: OSTI; NTIS (US Sales Only); GPO Dep.

At the INTRAVAL Working Group III meeting both WIPP test cases (the Salt Test Case and the Culebra Test Case) were discussed by foreign project team members. Modeling of brine inflow experiments, from the WIPP Salt Test Case, by the French team yielded permeability and storativity values consistent with those already derived by the WIPP project team. Modeling of variable density ground water flow above the WIPP site, pertinent to the WIPP Culebra Test Case, by the German team is not sufficiently far along to have yielded results. Difficulties with numerical simulation have delayed progress.

33802 (DOE/FTR–93016249) **Travel to Germany to participate in the 4th International KfK/TNO conference on contaminated soil: Foreign trip report, May 3–7, 1993.** Miller, D.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). 24 Jun 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93016249. Source: OSTI; NTIS (US Sales Only); GPO Dep.

For the first time, an international gathering of about 1000 experts (mostly Germans) in different fields of contaminated soil meeting Berlin, Germany, heard a number of talks on the EM/OTD mission, organization, and received an overview of RDDT&E, cleanup, and waste prevention activities. This was the fourth international conference on contaminated soils held in Europe and the first at which EM was a sponsor, gave significant invited papers. Specifically, the author's paper was one of a number of papers by EM and National Lab participants in the Workshop on Mixed Waste. Workshop attendees asked many questions and the session was very interactive. At least some Europeans now understand, in part EM's mixed waste cleanup needs and the role of advanced and innovative technologies in the cleanup of such contaminated sites.

33803 (DOE/FTR–93018609) **Travel to the Netherlands and Russia to assess electrokinetic technology as it is being applied to the remedial treatment of metal-contaminated soils and groundwater: Foreign trip report, December 11–19, 1991.** Adams, R.E. USDOE Oak Ridge Field Office, TN (United States). 8 Jan 1992. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93018609. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to serve as a member of an evaluation team composed of the Department of Energy (DOE) and DOE contractor personnel to evaluate and assess the state of international electrokinetic technology as it is being applied to the remedial treatment of metal-contaminated soils and groundwater. This travel was requested by the DOE Office of Technology Development (OTD) to determine whether electrokinetic technology research, development, and field demonstrations on foreign soils and groundwater have applicability for the remediation of metal contamination at DOE sites.

33804 (DOE/ID–22107) **Age dating ground water by use of chlorofluorocarbons (CCl_3F and CCl_2F_2), and distribution of chlorofluorocarbons in the unsaturated zone, Snake River Plain aquifer, Idaho National Engineering Laboratory, Idaho.** Busenberg, E.; Weeks, E.P.; Plummer, L.N.; Bartholomay, R.C.

Geological Survey, Idaho Falls, ID (United States). Apr 1993. 47p. Sponsored by Geological Survey, Reston, VA (United States). DOE Contract AC07-76ID01570. (USGS-WRI–93-4054). Order Number DE93019032. Source: OSTI; NTIS; INIS; GPO Dep.

Detectable concentrations of chlorofluorocarbons (CFC's) were observed in ground water and unsaturated-zone air at the Idaho National Engineering Laboratory (INEL) and vicinity. The recharge ages of waters were determined to be from 4 to more than 50 years on the basis of CFC concentrations and other environmental data; most ground waters have ages of 14 to 30 years. These results indicate that young ground water was added at various locations to the older regional ground water (greater than 50 years) within and outside the INEL boundaries. The wells drilled into the Snake River Plain aquifer at INEL sampled mainly this local recharge. The Big Lost River, Birch Creek, the Little Lost River, and the Mud Lake-Terreton area appear to be major sources of recharge of the Snake River Plain aquifer at INEL. An average recharge temperature of 9.7±1.3°C (degrees Celsius) was calculated from dissolved nitrogen and argon concentrations in the ground waters, a temperature that is similar to the mean annual soil temperature of 9°C measured at INEL. This similarity indicates that the aquifer was recharged at INEL and not at higher elevations that would have cooler soil temperatures than INEL. Soil-gas concentrations at Test Area North (TAN) are explained by diffusion theory.

33805 (DOE/MC/29109–3392) **Road Transportable Analytical Laboratory (RTAL) system: Quarterly technical report, December 1992–February 1993.** Engineering Computer Optecnomics, Inc., Annapolis, MD (United States). 22 Mar 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE93040019. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this contractual effort is the development and demonstration of a Road Transportable Analytical Laboratory (RTAL) system to meet the unique needs of the Department of Energy (DOE) for rapid, accurate analysis of a wide variety of hazardous and radioactive contaminants in soil, groundwater, and surface waters. This laboratory system will be designed to provide the field and laboratory analytical equipment necessary to detect and quantify radionuclides, organics, heavy metals and other inorganics, and explosive materials. The planned laboratory system will consist of a set of individual laboratory modules deployable independently or as an interconnected group to meet each DOE site's specific needs.

33806 (ECN-RX–93-053) **Storage restrictions and the preference for CO_2 removal options.** Okken, P.A. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). May 1993. 19p. Order Number DE93524584. Source: OSTI; NTIS; Available from the library of the Netherlands Energy Research Foundation (ECN), P.O. Box 1, 1755 ZG Petten (Netherlands).

Paper prepared for IEA CO_2 disposal symposium of the IEA Greenhouse R+D programme, Oxford, 29-31 March, 1993.

Carbon dioxide storage is a conditio sine qua non for carbon dioxide removal, i.e. recovery from fossil fuel conversion and storage in reservoirs outside the atmosphere. CO_2 storage capacity restrictions determine the cost-effectiveness of CO_2 removal techniques, preferring low-carbon high energy yield options. This is demonstrated in energy system model calculations, with variable CO_2 storage capacities and variable targets for CO_2 emission reduction. With restricted storage capacity the preference for CO_2 removal changes, from coal/synfuels to coal/power to gas/hydrogen conversion processes, at higher costs. 4 figs., 3 tabs., 3 refs.

33807 (EGG–10617-1219) **An aerial radiological survey of the Quad Cities Nuclear Power Station and surrounding area, Cordova, Illinois: Date of survey: May 1989.** Maurer, R.J. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Apr 1993. 12p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC08-93NV11265. Order Number DE93019093. Source: OSTI; NTIS; INIS; GPO Dep.

An aerial radiological survey was conducted over the Quad Cities Nuclear Power Station in Cordova, Illinois, during the period May 9 through May 18, 1989. The survey was conducted at an altitude of 61 meters (200 feet) over a 65-square-kilometer (25-square-mile) area centered on the power station. The purpose of the survey was to document the terrestrial gamma environment of the Quad Cities Power Station and surrounding area and to determine any radiological impact on the area over the past twenty years. The results of the aerial survey are reported as inferred gamma radiation exposure rates at 1 meter above ground level in the form of a contour map. Outside the plant boundary, exposure rates were found to vary between 5 and 15 microroentgens per hour (μR/h) and were attributed to naturally-occurring uranium, thorium, and radioactive potassium gamma emitters. The aerial data were compared to ground-based "benchmark" exposure rate measurements and radionuclide assay of soil samples obtained within the survey boundary. The ground-based measurements were found to be in good agreement with those inferred from the aerial measuring system.

33808 (EGG–10617-2155) **Population trends of San Joaquin kit fox (Vulpes velox macrotis) at Camp Roberts Army National Guard Training Site, California.** Berry, W.H.; Standley, W.G. EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. Oct 1992. 25p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93018484. Source: OSTI; NTIS; GPO Dep.

Population trends of a San Joaquin kit fox population (Vulpes velox macrotis) were investigated at Camp Roberts Army National Guard Training Site, California, from November 1989 through August 1991. Six semiannual livetrapping sessions and eight scent-station survey sessions were conducted. Livetrapping results and radiotelemetry data were used to calculate minimum population size, density, and distribution. A total of 175 individual foxes were trapped 463 times. The number of individuals trapped and minimum population size calculations showed a decline over time. The highest minimum population (109) was observed in winter 1988. Summer 1991 had the lowest minimum population size (45). No evidence was found to indicate that the apparent population decline was a result of military-authorized activities.

33809 (ENEA-RT-INN–92-41) **Report of first LASFLEUR field campaign for remote sensing of vegetation health: ENEA contribution.** Barbini, R. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Colao, F.; Fantoni, R.; Palucci, A.; Ribezzo, S. Nov 1992. 25p. (RT/INN–92-41). Order Number DE93522949. Source: OSTI; NTIS (US Sales Only); INIS.

The first European joint field campaign for the remote sensing of vegetation health was held in Viterbo (October 6 to 18, 1991) within the framework of the EUREKA/LASFLEUR project. Italian groups, from universities, ENEA (Italian Agency for Energy, New Technologies and the Environment) and CNR (Italian National Research Council), participated in this campaign together with several German groups from different institutes. The LIDAR (light detection and ranging) fluorosensor system built at the ENEA Frascati Research Center for the remote sensing of water and land was modified to detect fluorescence from trees in a field experiment. The new version of the set-up is presented in this paper together with the spectral and time resolved measurements that were performed. Results are discussed in view of correlating present data with the plant photosynthesis activity under different weather conditions and water stresses.

33810 (IAEA-SM–329/21/0) **Cesium-137 inventories in Alaskan Tundra, lake and marine sediments: An indicator of recent organic material transport?.** Grebmeier, J.M. (Oak Ridge National Lab., TN (United States)); Cooper, L.W.; Larsen, I.L.; Solis, C.; Olsen, C.R. International Atomic Energy Agency, Vienna (Austria); Oak Ridge National Lab., TN (United States). [1993]. 22p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); Department of the Interior, Washington, DC (United States). DOE Contract AC05-84OR21400. DPP 88-13046;DPP 89-21955;DPP 92-17666. (CONF-930412–1: International symposium on the application of isotope techniques in studying past and current environmental changes in the hydrosphere and atmosphere, Vienna (Austria), 19-23 Apr 1993). Order Number DE93015888. Source: OSTI; NTIS; INIS; GPO Dep.

Tundra sampling was accomplished in 1989–1990 at Imnavait Creek, Alaska (68°37' N, 149°17' W). Inventories of ^{137}Cs (102–162 mBq/cm^2) are close to expectations, based upon measured atmospheric deposition for this latitude. Accumulated inventories of ^{137}Cs in tundra decrease by up to 50% along a transect to Prudhoe Bay (70°13' N, 148°30' W). Atmospheric deposition of ^{137}Cs decreased with latitude in the Arctic, but declines in deposition would have been relatively small over this distance (200 km). This suggests a recent loss of ^{137}Cs and possibly associated organic matter from tundra over the northern portions of the transect between Imnavait Creek and Prudhoe Bay. Sediments from Toolik Lake (68°38' N, 149°38' W) showed widely varying ^{137}Cs inventories, from a low of 22 mBq/cm^2 away from the lake inlet, to a high between 140 to >200 mBq/cm^2 near the main stream inflow. This was indicative of recent accumulation of cesium and possibly organic material associated with it in arctic lakes, although additional sampling is needed.

33811 (INIS-RU–347, pp. 419) **Study on the beta and gamma isotope concentration in environment beyond the 30 km Chernobyl NPP accident zone.** Belyavenko, V.S. (AN Ukrainskoj SSR, Kiev (Ukraine). 33814 (LA-UR–93-2934) **Uranium speciation in Fernald soils: Progress report, October 1, 1992–May 31, 1993: Revision 1.** Donohoe, R.J.; Morris, D.E.; Musgrave, J.A.; Tait, C.D.; Conradson, S.D. Los Alamos National Lab., NM (United States). 16 Jul 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93040098. Source: OSTI; NTIS; INIS; GPO Dep.

This interim progress report describes new experimental data collected from October 1, 1992 through May 31, 1993 as part of the Characterization Task of the Uranium in Soils Integrated Demonstration of the Office of Technology Development, Office of Environmental Restoration and Waste Management of the United States Department of Energy. X-ray absorption and optical luminescence spectroscopies have been used to analyze the uranium remaining in contaminated soils from the Fernald site after these samples were treated by various decontamination technologies under development within this Integrated Demonstration. The treatment technologies included soil washes with carbonate, citrate, Tiron, and Tiron/dithionite mixtures. The effectiveness of these procedures is discussed in a separate report from the Decontamination Task group. The characterization results indicate that following the application of all of these treatment strategies the uranium remaining in the soil is still best characterized as being primarily in the hexavalent oxidation state. However, for the A-series soils from the Incinerator Area, the speciation of this remaining uranium is different than seen previously based on the x-ray absorption data. The luminescence data for these treated soils also demonstrate that there is a decrease in size and quantity of the particulate hexavalent uranium that gives rise to the structured green emission. Thus, all treatment technologies do seem to generate a more dispersed, finer-grained form of uranium. For several treated samples a characteristic luminescence signal was found indicative of a schoepite phase of uranium. New results are also reported for untreated Fernald soil samples and reference uranium mineral phases.

33815 (LA-UR–93-2935) **Uranium speciation in Fernald soils: Progress report, January 1–May 31, 1992.** Morris, D.E.; Conradson, S.D.; Tait, C.D.; Chisholm-Brause, C.J.; Berg, J.; Musgrave, J. Los Alamos National Lab., NM (United States). 31 May 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93040097. Source: OSTI; NTIS; INIS; GPO Dep.

This report details progress made from January 1 to May 31, 1992 in this analytical support task to determine the speciation of uranium in contaminated soil samples from the Fernald Environmental Management Project site under the auspices of the Uranium in Soils Integrated Demonstration funded through the US DOE's Office of Technology Development. The authors' efforts have focused on characterization of soil samples collected by S.Y. Lee (Oak Ridge National Laboratory) from five locales at the Fernald site. These were chosen to sample a broad range of uranium source terms. On the basis of x-ray absorption spectroscopy data, they have determined that the majority of uranium (> 80–90%) exists in the hexavalent oxidation state for all samples examined. This is a beneficial finding from the perspective of remediation, because U(VI) species are more soluble in general than uranium species in other oxidation states. Optical luminescence data from many of the samples show the characteristic structured yellow-green emission from the uranyl (UO_2^{2+}) moiety. The luminescence data also suggest that much of the uranium in these soils is present as well-crystallized UO_2^{2+} species. Some clear spectroscopic distinctions have been noted for several samples that illustrate significant differences in the speciation (1) from site to site, (2) within different horizons at the same site, and (3) within different size fractions of the soils in the same horizon at the same site. This marked heterogeneity in uranyl speciation suggests that several soil washing strategies may be necessary to reduce the total uranium concentrations within these soils to regulatory limits.

33816 (LBL–33984) **Heterogeneous slip and rupture models of the San Andreas fault zone based upon three-dimensional earthquake tomography.** Foxall, W. Lawrence Berkeley Lab., CA (United States). Nov 1992. 178p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015037. Source: OSTI; NTIS; GPO Dep.

Crystal fault zones exhibit spatially heterogeneous slip behavior at all scales, slip being partitioned between stable frictional sliding, or fault creep, and unstable earthquake rupture. An understanding the mechanisms underlying slip segmentation is fundamental to research into fault dynamics and the physics of earthquake generation. This thesis investigates the influence that large-scale

along-strike heterogeneity in fault zone lithology has on slip segmentation. Large-scale transitions from the stable block sliding of the Central 4D Creeping Section of the San Andreas, fault to the locked 1906 and 1857 earthquake segments takes place along the Loma Prieta and Parkfield sections of the fault, respectively, the transitions being accomplished in part by the generation of earthquakes in the magnitude range 6 (Parkfield) to 7 (Loma Prieta). Information on sub-surface lithology interpreted from the Loma Prieta and Parkfield three-dimensional crustal velocity models computed by Michelini (1991) is integrated with information on slip behavior provided by the distributions of earthquakes located using, the three-dimensional models and by surface creep data to study the relationships between large-scale lithological heterogeneity and slip segmentation along these two sections of the fault zone.

33817 (NUREG/CP–0040, pp. 43-53) **Does the wind blow through Yucca Mountain?.** Weeks, E.P. (Geological Survey, Denver, CO (US)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory Analyses; Arizona Univ., Tucson, AZ (United States). Dept. of Hydrology and Water Resources. Jun 1993. (CONF-9101106–: 5. flow and transport through unsaturated fractured rock related to high-level radioactive waste disposal, Tucson, AZ (United States), 7-10 Jan 1991). In *Proceedings of workshop 5: Flow and transport through unsaturated fractured rock – related to high-level radioactive waste disposal.* 238p. Source: OSTI; NTIS; INIS; GPO.

Beginning in February 1986, substantial net discharge of rock gas has been observed from a well located on the crest of Yucca Mountain that taps unsaturated fractured rock. Until recently, this net discharge was attributed entirely to a density contrast between slightly geothermally heated water vapor saturated rock gas and cooler, much drier atmospheric air. However, the net discharge is too large to be explained by the temperature and water vapor induced density contrast alone. A portion of this excess flow is now attributed to a wind effect. Hypothetically, as the wind blows against the mountain, the pressure increases along the flank due to a bluff or form-drag effect, and decreases at its crest due to an airfoil effect. This paper further examines the possibility of a wind effect on airflow from wells on Yucca Mountain. 9 refs., 3 figs., 1 tab.

33818 (ORNL/GWPO–003) **The deep hydrogeologic flow system underlying the Oak Ridge Reservation.** Nativ, R. (Hebrew Univ., Jerusalem (IL)); Hunley, A.E. Oak Ridge National Lab., TN (United States). Jul 1993. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019601. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication 4097.

The deep hydrogeologic system underlying the Oak Ridge Reservation contains some areas contaminated with radionuclides, heavy metals, nitrates, and organic compounds. The groundwater at that depth is saline and has previously been considered stagnant. On the basis of existing and newly collected data, the nature of flow of the saline groundwater and its potential discharge into shallow, freshwater systems was assessed. Data used for this purpose included (1) spatial and temporal pressures and hydraulic heads measured in the deep system, (2) hydraulic parameters of the formations in question, (3) spatial temperature variations, and (4) spatial and temporal chemical and isotopic composition of the saline groundwater. In addition, chemical analyses of brine in adjacent areas in Tennessee, Kentucky, Ohio, Pennsylvania, and West Virginia were compared with the deep water underlying the reservation to help assess the origin of the brine. Preliminary conclusions suggest that the saline water contained at depth is old but not isolated (in terms of recharge and discharge) from the overlying active and freshwater-bearing units. The confined water (along with dissolved solutes) moves along open fractures (or man-made shortcuts) at relatively high velocity into adjacent, more permeable units. Groundwater volumes involved in this flow probably are small.

Environmental Sciences Division Publication No. 3995.

Areas on the Oak Ridge Reservation (ORR) that contain rare plant or animal species or are special habitats are protected through National Environmental Research Park Natural Area (NA) or Reference Area (RA) designations. The US Department of Energy's Oak Ridge National Environmental Research Park program is responsible for identifying species of vascular plants that are endangered, threatened, or rare and, as much as possible, for conserving those areas in which such species grow. This report includes a listing of Research Park NAs and RAs with general habitat descriptions and a computer-generated map with the areas identified. These are the locations of rare plant or animal species or special habitats that are known at this time. As the Reservation continues to be surveyed, it is expected that additional sites will be designated as Research Park NAs or RAs. This document is a component of a larger effort to identify environmentally sensitive areas on ORR. This report identifies the currently known locations of rare plant species, rare animal species, and special biological communities. Floodplains, wetlands (except those in RAs or NAs), and cultural resources are not included in this report.

33820 (ORNL/TM–12217) **Pilot uranium lysimeter studies at the Oak Ridge Y-12 plant.** Francis, C.W.; Hyder, L.K.; Howard, S.C.; Cline, J.E.; Clapp, R.B. Oak Ridge National Lab., TN (United States). Aug 1993. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019361. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Divison Publication No. 3981.

A field lysimeter test facility has been constructed at the Oak Ridge Y-12 plant to evaluate land burial of wastes containing depleted uranium. The principal objective in the construction of such a facility is to provide a means for monitoring waste leachate characteristics over time, in particular uranium concentrations in leachate. The design of the field lysimeter test facility allows, via the portals along the side walls of the lysimeter, the collection of leachate as a function of depth in the lysimeter. The methodology to collect leachate from within the field lysimeter has not been clearly defined. Thus, before wastes were loaded into the field lysimeter facility, a pilot lysimeter study was initiated to test several design concepts for the collection of in situ leachate. The primary objective of this pilot study was to demonstrate the feasibility and quality assurance of proposed instrumentation used to monitor leachate generation and characteristics in the full-scale field lysimeter. Secondary objectives included gaining experience in the handling/packing of wastes, installation/operation of the leachate collection devices, and waste leachate characterization.

33821 (ORNL/TM–12225) **Radiological survey results at the former Bridgeport Brass Company facility, Seymour, Connecticut.** Foley, R.D.; Carrier, R.F. Oak Ridge National Lab., TN (United States). Jun 1993. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93017987. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the US Department of Energy (DOE), a team from Oak Ridge National Laboratory conducted a radiological survey of the former Bridgeport Brass Company facility, Seymour, Connecticut. The survey was performed in May 1992. The purpose of the survey was to determine if the facility had become contaminated with residuals containing radioactive materials during the work performed in the Ruffert building under government contract in the 1960s. The survey included a gamma scanning over a circumscribed area around the building, and gamma and beta-gamma scanning over all indoor surfaces as well as the collection of soil and other samples for radionuclide analyses. Results of the survey demonstrated radionuclide concentrations in indoor and outdoor samples, and radiation measurements over floor and wall surfaces, in excess of the DOE Formerly Utilized Sites Remedial Action Program guidelines. Elevated uranium concentrations outdoors were limited to several small, isolated spots. Radiation measurements

exceeded guidelines indoors over numerous spots and areas inside the building, mainly in Rooms 1–6 that had been used in the early government work.

33822 (ORNL/TM–12260) **X-231B technology demonstration for in situ treatment of contaminated soil: Laboratory evaluation of in situ vapor stripping.** West, O.R. (Oak Ridge National Lab., TN (US)); Siegrist, R.L.; Jennings, H.L.; Lucero, A.J.; Greene, D.W.; Schmunk, S.W. Oak Ridge National Lab., TN (United States). Jun 1993. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019397. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4105.

The goal of the study described in this report was to determine the efficiency of vapor stripping coupled with soil mixing for removing volatile organic compounds (VOCs) from clay soils such as those that underlie the PORTS X-231B Solid Waste Management Unit. This was accomplished by conducting experiments wherein contaminated soil cores were treated in the laboratory using a system that simulated a field-scale vapor stripping/soil mixing treatment process. Treatment efficiencies obtained using several sets of process conditions, such as air temperature and flow rate, were determined through subsampling of the soil cores to establish pre- and posttreatment levels of VOCs in the soil. Two series of experiments were conducted under this study. In the first series, laboratory treatment was performed on intact soil cores that were taken from contaminated zones within the PORTS X-231B Unit using sampler liners that could be adapted as reaction lysimeters. Since soil core disturbance was minimized using this approach, the treatability experiments were conducted on soil that was fairly close to in situ conditions in terms of both soil structure and contaminant levels. The second series of experiments were performed on cores that were packed using X-231B soil and spiked with known amounts of trichloroethylene (TCE). This approach was taken for the second series because the VOC levels in the intact cores were found to be much lower than field values. In addition, the packed cores were smaller than the intact soil cores, with treatment volumes that were about a fifth of the treatment volumes in the intact soil cores. The smaller packed cores were not only easier to handle but were also more reliably characterized due to smaller treatment volumes from which samples were taken.

33823 (ORNL/TM–12317) **In situ treatment of VOCs by recirculation technologies.** Siegrist, R.L. (Oak Ridge National Lab., TN (US)); Webb, O.F.; Ally, M.R.; Sanford, W.E.; Kearl, P.M.; Zutman, J.L. Oak Ridge National Lab., TN (United States). Jun 1993. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93017850. Environmental Sciences Division Publication No. 4056.

The project described herein was conducted by Oak Ridge National Laboratory (ORNL) to identify processes and technologies developed in Germany that appeared to have near-term potential for enhancing the cleanup of volatile organic compound (VOC) contaminated soil and groundwater at DOE sites. Members of the ORNL research team identified and evaluated selected German technologies developed at or in association with the University of Karlsruhe (UoK) for in situ treatment of VOC contaminated soils and groundwater. Project activities included contacts with researchers within three departments of the UoK (i.e., Applied Geology, Hydromechanics, and Soil and Foundation Engineering) during fall 1991 and subsequent visits to UoK and private industry collaborators during February 1992. Subsequent analyses consisted of engineering computations, groundwater flow modeling, and treatment process modeling. As a result of these project efforts, two processes were identified as having near-term potential for DOE: (1) the vacuum vaporizer well/groundwater recirculation well and (2) the porous pipe/horizontal well. This document was prepared to summarize the methods and results of the assessment activities completed during the initial year of the project. The project is still ongoing, so not all facets of the effort are completely described in this document. Recommendations for laboratory and field experiments are provided.

33824 (PNL–8662) **Arid site characterization and technology assessment: Volatile Organic Compounds-Arid Integrated Demonstration.** Riley, R.G. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016708. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy's (DOE's) Volatile Organic Compounds-Arid Integrated Demonstration (VOC-Arid ID) program was initiated in March 1991 to evaluate technologies for all phases of remediation of VOCs in soils and groundwater at DOE arid/semiarid sites. The primary site for field demonstrations under the VOC-Arid ID program is the Hanford Site. The purpose of this report is to describe (1) the bases for technologies currently under evaluation in the VOC-Arid ID program; (2) the types of subsurface contamination at DOE arid/semiarid sites; and (3) the areas of potential common technology interests based on perceived technology needs at other DOE sites. This report was compiled by Pacific Northwest Laboratory in response to DOE's Office of Technology Development's mission to carry out an aggressive program to accelerate the development and implementation of new and existing technologies to meet a 30-year goal set by DOE in June 1989 to clean up all of its sites and to bring all sites into compliance with current and future environmental regulations. A key component of this program is the development of technologies that are better, faster, safer, and cheaper than those technologies currently available. Included in this report are an evaluation of technologies currently (fiscal year 1993) being pursued at the Hanford Site under the auspices of the VOC-Arid ID program, an assessment of subsurface contaminants at arid/semiarid sites, a summarization of technologies under consideration at other DOE sites, a discussion of areas of potential common technology interests, and the conclusions. Also included are a summary of the extent of contamination at the DOE arid/semiarid sites under consideration and a bibliography of source documents from which this report was prepared.

33825 (PNL–8676) **Hanford Cultural Resources Laboratory annual report for fiscal year 1992.** Chatters, J.C.; Gard, H.A.; Wright, M.K.; Crist, M.E.; Longenecker, J.G.; O'Neil, T.K.; Dawson, M.V. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 113p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017231. Source: OSTI; NTIS; GPO Dep.

The Hanford Cultural Resources Laboratory (HCRL) was established by the US Department of Energy, Richland Field Office (RL) in 1987 as part of Pacific Northwest Laboratory (PNL). The HCRL provides support for managing the archaeological, historical, and cultural resources of the Hanford Site located in southcentral Washington, in a manner consistent with the National Historic Preservation Act Amended 1992 (NBPA), the Archaeological Resources Protection Act of 1979 (ARPA), the Native American Grave Protection and Repatriation Act of 1990 (NAGPRA), and the American Indian Religious Freedom Act of 1978 (AIRFA). The HCRL responsibilities have been set forth in the Hanford Cultural Resources Management Plan as a prioritized list of tasks to be undertaken to keep the RL in compliance with federal statutes, regulations, and guidelines. For FY 1992, these tasks were to (1) ensure compliance with NBPA Section 106, (2) monitor the condition of known archaeological sites, (3) evaluate cultural resources for potential nomination to the National Register of Historic Places, (4) educate the public about cultural resources, and (5) conduct a sample archaeological survey of Hanford lands. Research was also conducted as a spin-off of these tasks and is also reported here.

33826 (PNL-SA–21625) **In situ stimulation vs. bioaugmentation: Can microbial inoculation of plant roots enhance biodegradation of organic compounds?.** Kingsley, M.T. (Pacific Northwest Lab., Richland, WA (United States)); Metting, F.B. Jr.; Fredrickson, J.K.; Seidler, R.J. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930647–6: 86. annual meeting and exhibition of the Air and Waste Management Association (AWMA), Denver, CO (United States), 13-18 Jun 1993). Order Number DE93017218. Source: OSTI; NTIS; GPO Dep.

The use of plant roots and their associated rhizosphere bacteria for biocontainment and biorestoration offers several advantages for treating soil-dispersed contaminants and for application to large

land areas. Plant roots function as effective delivery systems, since root growth transports bacteria vertically and laterally along the root in the soil column (see [1,2]). Movement of microbes along roots and downward in the soil column can be enhanced via irrigation [1-4]. For example, Ciafardini et al. [3] increased the nodulation and the final yield of soybeans during pod filling by including Bradyrhizobium japonicum in the irrigation water. Using rhizosphere microorganisms is advantageous for biodegradation of compounds that are degraded mainly by cometabolic processes, e.g., trichloroethylene (TCE). The energy source for bacterial growth and metabolism is supplied by the plant in the form of root exudates and other sloughed organic material. Plants are inexpensive, and by careful choice of species that possess either tap or fibrous root growth patterns, they can be used to influence mass transport of soil contaminants to the root surface via the transpiration stream [5]. Cropping of plants to remove heavy metals from contaminated soils has been proposed as a viable, low-cost, low-input treatment option [6]. The interest in use of plants as a remediation strategy has even reached the popular press [7], where the use of ragweed for the reclamation of sites contaminated with tetraethyl lead and other heavy metals was discussed.

33827 (UCRL-ID–104740) **Beryllium in soils of the Nevada Test Site: A preliminary assessment.** Patton, S.E. Lawrence Livermore National Lab., CA (United States). Jul 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93016951. Source: OSTI; NTIS; GPO Dep.

A preliminary assessment of the occurrence and distribution of beryllium in soils of the Nevada Test Site (NTS) was conducted by identifying sites on the NTS where beryllium might have been used in past operations and measuring current soil beryllium concentrations at those sites. Eighty-one soil samples were collected from six sites on the NTS. The six sites were chosen after interviews with persons who are or were involved with NTS operations and stated that beryllium might have been used in operations at those sites. The soil samples were prepared for analysis using EPA procedures and analyzed by flame-atomic-absorption spectrophometry. Beryllium concentrations in the soil samples ranged from the analytical detection limit of 0.46 parts-per-million (ppM) to 4.65 ppM. The beryllium concentrations in NTS soils may be higher than estimated local background soil beryllium concentrations, but in concentrations that fall within the range found in surface soils of the United States. Air beryllium concentrations were conservatively estimated to be considerably lower than regulatory exposure limits. Further work is recommended in assessing the spatial distribution of beryllium in soils around several of the sites, with a sampling design that incorporates statistical procedures to ensure statistically valid results.

33828 (UCRL-JC–109902) **Dynamic Underground Stripping Project.** Aines, R. (Lawrence Livermore National Lab., CA (United States)); Newmark, R.; McConachie, W.; Udell, K.; Rice, D.; Ramirez, A.; Siegel, W.; Buettner, M.; Daily, W.; Krauter, P.; Folsom, E.; Boegel, A.J.; Bishop, D.; Udell, K. Lawrence Livermore National Lab., CA (United States). Jan 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920307–94: Waste management '92, Tucson, AZ (United States), 1-5 Mar 1992). Order Number DE93013133. Source: OSTI; NTIS; INIS; GPO Dep.

LLNL is collaborating with the UC Berkeley College of Engineering to develop and demonstrate a system of thermal remediation and underground imaging techniques for use in rapid cleanup of localized underground spills. Called "Dynamic Stripping" to reflect the rapid and controllable nature of the process, it will combine steam injection, direct electrical heating, and tomographic geophysical imaging in a cleanup of the LLNL gasoline spill. In the first 8 months of the project, a Clean Site engineering test was conducted to prove the field application of the techniques before moving the contaminated site in FY 92.

33829 (UCRL-JC–113731) **A new fiber-optic sensor technology for rapid and inexpensive characterization of soil contamination.** Milanovich, F.P. (Lawrence Livermore National Lab., CA (United States)); Brown, S.B.; Colston, B.W. Jr.; Daley, P.F.; Rossabi, J. Lawrence Livermore National Lab., CA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930589–4: 4. international conference on contaminated soil, Berlin (Germany), 3-7 May 1993). Order Number DE93017973. Source: OSTI; NTIS; INIS; GPO Dep.

The extent and complexity of worldwide environmental contamination are great enough that remediation will be extremely costly and lengthy. There is an urgent need for characterization techniques that are rapid, inexpensive, and simple and that do not generate waste. Towards this end LLNL is developing a fiber-optic chemical sensor technology for use in groundwater and vadose-zone monitoring. We use a colorimetric detection technique, based on an irreversible chemical reaction between a specific reagent and the target compound. The accuracy and sensitivity of the sensor (<5 ppb by weight in water, determined by comparison with gas chromatographic standard measurements) are sufficient for environmental monitoring of at least trichloroethylene (TCE) and chloroform.

33830 (WHC-EP–0595) **Westinghouse Hanford Company Operational Groundwater status report, 1990–1992.** Johnson, V.G. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 509p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93017594. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents information related to the water quality of ground water at the Hanford Reservation. Included are plume maps, geology, hydrology, and information on various effluent sources.

33831 (WHC-SD-EN-AP–129-Rev.1) **Description of work for the 200-UP-1 groundwaters contaminant vertical profiling activity: Revision 1.** Ford, B.H. Westinghouse Hanford Co., Richland, WA (United States). 28 Jul 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93018741. Source: OSTI; NTIS; GPO Dep.

This description of work (DOW) details the field activities associated with assessing the vertical extent of groundwater contamination in the uppermost unconfined and confined aquifers beneath the southeastern portion of the 200 West area. The document serves as the test plan for those performing the work. It should be used in conjunction with the Remedial Investigation/ Feasibility Study Work Plan for the 200-UP-1 Groundwater Operable Unit, Hanford Site, Richland, Washington (200-UP-1 Operable Unit Workplan) (DOE/RL 1991) for general investigation strategy and with specific procedures. Work scope for the vertical profiling activity is defined in sections 4.2 and 5.1.3 of the 200-UP-1 Operable Unit Workplan. The work is one portion of a proposed Limited Field Investigation (LFI) data collection program.

33832 (WHC-SD-EN-TI–110) **QA/QC requirements for physical properties sampling and analysis.** Innis, B.E. Westinghouse Hanford Co., Richland, WA (United States). 21 Jul 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93018745. Source: OSTI; NTIS; GPO Dep.

This report presents results of an assessment of the available information concerning US Environmental Protection Agency (EPA) quality assurance/quality control (QA/QC) requirements and guidance applicable to sampling, handling, and analyzing physical parameter samples at Comprehensive Environmental Restoration, Compensation, and Liability Act (CERCLA) investigation sites. Geotechnical testing laboratories measure the following physical properties of soil and sediment samples collected during CERCLA remedial investigations (RI) at the Hanford Site: moisture content, grain size by sieve, grain size by hydrometer, specific gravity, bulk density/porosity, saturated hydraulic conductivity, moisture retention, unsaturated hydraulic conductivity, and permeability of rocks by flowing air. Geotechnical testing laboratories also measure the following chemical parameters of soil and sediment samples collected during Hanford Site CERCLA RI: calcium carbonate and saturated column leach testing. Physical parameter data are used for (1) characterization of vadose and saturated zone geology and hydrogeology, (2) selection of monitoring well screen sizes, (3) to support modeling and analysis of the vadose and saturated zones, and (4) for engineering design. The objectives of this report are to

determine the QA/QC levels accepted in the EPA Region 10 for the sampling, handling, and analysis of soil samples for physical parameters during CERCLA RI.

33833 (WHC-SD-EN-TI-171) **Electronic cone penetration testing at the Hanford Site, 200 West Area.** Rohay, V.J. Hanford Engineering Development Lab., Richland, WA (United States). 4 Jun 1993. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93018746. Source: OSTI; NTIS; GPO Dep.

The 200 West Area Carbon Tetrachloride Expedited Response Action (ERA) is being conducted by the US Department of Energy (DOE) at the direction of the US Environmental Protection Agency (EPA) and the Washington Department of Ecology as a provision of both the Comprehensive Environmental Response Compensation and Liability Act of 1980 (CERCLA) and the Integrated Demonstration for Cleanup of Volatile Organic Compounds at Arid Sites (VOC-Arid ID). The ERA allows expedited response to be taken at waste sites where damage to the environment can be significantly reduced by early action to locate, identify the extent, and remediate imminent hazards. The ERA is focusing specifically on the removal of carbon tetrachloride vapor from the soil column and protection of the groundwater in the 200 West Area. The VOC-Arid ID program allows demonstration of new drilling technologies for environmental characterization monitoring and remediation. Soil vapor vacuum extraction has been proposed to remediate the site. This may require vapor extraction wells to be installed within the plume.

33834 (WSRC-MS-93-361) **Applications of Quaternary stratigraphic, soil-geomorphic, and quantitative geomorphic analyses to the evaluation of tectonic activity and landscape evolution in the Upper Coastal Plain, South Carolina.** Hanson, K.L. (Geomatrix Consultants, Inc., San Francisco, CA (United States)); Bullard, T.F.; de Wit, M.W.; Stieve, A.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9310102--1: 4. energy natural phenomena hazards mitigation conference, Atlanta, GA (United States), 19-22 Oct 1993). Order Number DE93016269. Source: OSTI; NTIS; GPO Dep.

Geomorphic analyses combined with mapping of fluvial terraces and upland geomorphic surfaces provide new approaches and data for evaluating the Quaternary activity of post-Cretaceous faults that are recognized in subsurface data at the Savannah River Site in the Upper Coastal Plain of southwestern South Carolina. Analyses of longitudinal stream and terrace profiles, regional slope maps, and drainage basin morphometry indicate long-term uplift and southeast tilt of the site region. Preliminary results of drainage basin characterization suggests an apparent rejuvenation of drainages along the trace of the Pen Branch fault (a Tertiary reactivated reverse fault that initiated as a basin-margin normal fault along the northern boundary of the Triassic Dunbarton Basin). This apparent rejuvenation of drainages may be the result of nontectonic geomorphic processes or local tectonic uplift and tilting within a framework of regional uplift.

33835 (WSRC-RP-93-0723) **Estimation of Ni^{63}, Pu^{241}, Pu^{242} and Am^{243} from Co^{60}, Pu^{239}, and Cm^{244} activities in groundwater samples.** Holcomb, H.P. Westinghouse Savannah River Co., Aiken, SC (United States). 14 May 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93018774. Source: OSTI; NTIS; INIS; GPO Dep.

The Part B Permit for F&H Seepage Basins calls for analysis of several constituents of concern in groundwater monitoring wells. Four of these analytes are the radionuclides Ni^{63}, Pu^{241}, Pu^{242}, and Am^{243}. These are currently not being analyzed due to their very difficult, tedious analytical schemes coupled with their relatively low activity values. This report demonstrates how the activity value for Ni^{63}, a week beta emitter, can be estimated from that of Co^{60}, an easily detectable, high-energy gamma emitter. Similarly, estimates of Pu^{241}, a beta emitter, and the alpha-emitting Pu^{242} can be made from the activity value of the more easily detected Pu^{239}. Am^{243} can be estimated from the activity of Cm^{244}, which is easier to detect because of a shorter half-life (higher specific activity) and the emission of higher energy alpha particles. These correlations are made under very specific parameters in order to ensure the validity of this approach. Therefore, assumptions must be established setting ground rules for establishing these activity relationships. Bases for these assumptions are explained and/or referenced. Their degree of uncertainty limits the accuracy of the data so that the term "estimate" is used. Such soundly-based, conservative estimates for these four rads can provide a tool for evaluating any hazards from their presence over the next several years. Hopefully, during this time, sufficient advances will be made in their radiochemical analyses and in counting techniques so that in the future, their activities may be quantitatively determined more easily and also more cost effectively.

33836 (WSRC-TR-93-273) **F- and H-Area Sewage Sludge Application Sites groundwater monitoring report.** Westinghouse Savannah River Co., Aiken, SC (United States). Jul 1993. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93019839. Source: OSTI; NTIS; GPO Dep.

Samples from the four wells at the F-Area Sewage Sludge Application Site (FSS wells) and the three wells at the H-Area Sewage Sludge Application Site (HSS wells) are analyzed quarterly for constituents as required by South Carolina Department of Health and Environmental Control Construction Permit 12,076 and, as requested, for other constituents as part of the Savannah River Site Groundwater Monitoring Program. Annual analyses for other constituents, primarily metals, also are required by the permit. Historically and currently, no permit-required analytes exceed standards at the F- and H-Area Sewage Sludge Application Sites except iron, lead, and manganese, which occur in elevated concentrations frequently in FSS wells and occasionally in HSS wells. Tritium and aluminum are the primary nonpermit constituents that exceed standards at the F-Area Sewage Sludge Application Site. Other constituents also exceed standards at this site but only sporadically.

33837 (WSRC-TR-93-275) **F-Area Acid/Caustic Basin Groundwater Monitoring Report: First quarter 1993.** Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1993. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93019834. Source: OSTI; NTIS; GPO Dep.

During first quarter 1993, samples from the six FAC monitoring wells at F-Area Acid/Caustic Basin were analyzed for indicator parameters, groundwater quality parameters, parameters indicating suitability as drinking water, and other constituents. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are the focus of this report. Dichloromethane exceeded the final PDWS in four wells, including upgradient well FAC 3. Gross alpha exceeded the final PDWS in three wells, including upgradient well FAC 3. Aluminum and iron each exceeded Flag 2 criteria in five of the six wells. Total organic halogens exceeded the Flag 2 criterion in three wells, manganese in two, and total alpha-emitting radium, total organic carbon, and lead in one each. Turbidity exceeded the SRS standard in well FAC 3.

33838 (WSRC-TR-93-276) **H-Area Acid/Caustic Basin groundwater monitoring report.** Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1993. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93019835. Source: OSTI; NTIS; GPO Dep.

During first quarter 1993, samples from the four HAC monitoring wells at the H-Area Acid/Caustic Basin received comprehensive analyses. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are the focus of this report. Tritium exceeded the final PDWS only in well HAC 1 during first quarter 1993. Aluminum exceeded its Flag 2 criterion in wells HAC 2, 3, and 4. Iron was elevated in well HAC 1, 2, and 3. No well samples exceeded the SRS turbidity standard.

33839 (WSRC-TR–93-277) **K-Area Acid/Caustic Basin groundwater monitoring report: First quarter 1993.** Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1993. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93019613. Source: OSTI; NTIS; GPO Dep.

During first quarter 1993, samples from the KAC monitoring wells at the K-Area Acid/Caustic Basin were analyzed for indicator parameters, groundwater quality parameters, parameters indicating suitability as drinking water, and other constituents. Wells KAC 8 and 9 also were sampled for GC/MS VOA (gas chromatograph/mass spectrometer volatile organic analyses). Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are discussed in this report. Aluminum exceeded its Flag 2 criterion in wells KAC 6, 7, 8, and 9. Iron exceeded the Flag 2 criterion in wells KAC 6, 7, and 8, lead was elevated in well KAC 7, and specific conductance exceeded the Flag 2 criterion in well KAC 9. No samples exceeded the SRS turbidity standard.

33840 (WSRC-TR–93-278) **P-Area Acid/Caustic Basin groundwater monitoring report: First quarter 1993.** Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93019829. Source: OSTI; NTIS; GPO Dep.

During first quarter 1993, samples from the six PAC monitoring wells at the P-Area Acid/Caustic Basin were analyzed for indicator parameters, groundwater quality parameters, and parameters characterizing suitability as a drinking water supply. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are discussed in this report. During first quarter 1993, no constituents exceeded the final PDWS. Aluminum exceeded the SRS Flag 2 criterion in four of the wells. Iron and manganese each exceeded its Flag 2 criterion in wells PAC 2, 5, and 6.

33841 (WSRC-TR–93-280) **Sanitary Landfill groundwater monitoring report: First quarter 1993.** Westinghouse Savannah River Co., Aiken, SC (United States). May 1993. 182p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93040069. Source: OSTI; NTIS; GPO Dep.

This report contains analytical data for samples taken during first quarter 1993 from wells of the LFW series located at the Sanitary Landfill at the Savannah River Site. The data are submitted in reference to the Sanitary Landfill Operating Permit (DWP-087A). The report presents monitoring results that equaled or exceeded the Safe Drinking Water Act final Primary Drinking Water Standards (PDWS) or screening levels, established by the US Environmental Protection Agency, the South Carolina final Primary Drinking Water Standards for lead or the SRS flagging criteria.

33842 (WSRC-TR–93-320) **Four Mile Creek semi-annual sampling report, January 1993 sampling event.** Westinghouse Savannah River Co., Aiken, SC (United States); Metcalf and Eddy, Inc., Wakefield, MA (United States). May 1993. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93018772. Source: OSTI; NTIS; INIS; GPO Dep.

From 1955 to 1988 low-level radioactive wastewater generated by chemical separation processes within the General Separations Area (GSA) was discharged to seepage basins in the F and H Areas of the Savannah River Site (SRS). These basins were designed to permit the infiltration of the process wastewaters. As wastewater percolated downward through the basins, chemical and radioactive constituents were retained or sequestered in the subsoils. An extensive study aimed at characterizing the groundwater seeping into Four Mile Creek and its associated seepline was conducted in 1988 and 1989 (Haselow et al. 1990). Results of this study suggested that contaminants leaching from the F and H Area seepage basins were impacting the Four Mile Creek wetland system. The seepage basins were closed in 1988 and capped and sealed in 1990. This effectively eliminated the source of the contaminants and the hydraulic head driving the migration of contaminants from the basins. It has been hypothesized that, after the elimination of the source and head, annual rainfall amounts would be sufficient to dilute and flush out contaminants remaining in the subsoils and groundwaters beneath the basins. Westinghouse Savannah River Company has designed a semi-annual sampling and analytical program for the Four Mile Creek (FMC) seepline and stream water to test the hypothesis. This report summarizes field monitoring activities from January 25, 1993 to February 4, 1993.

This report presents data for monthly mean streamflows adjusted for storage change, evaporation, and irrigation, for the years 1928-1990, for the Colorado River Basin, the Missouri River Basin, the Peace River Basin, and the Slave River Basin.

33844 (DOE/FTR–93015192) **Meeting in Austria on the validation of models for predicting radionuclide transfer in terrestrial, aquatic, and urban environments: Foreign trip report, February 29–March 7, 1992.** Napier, B.A. Pacific Northwest Lab., Richland, WA (United States). 2 Apr 1992. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93015192. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This was the fourth annual meeting of the coordinated research program on the validation of dose assessment models using data derived from the Chernobyl accident. The four working groups; terrestrial, aquatic, urban, and multiple pathways, each presented on their progress in the last year. A number of draft documents dealing with important aspects of radionuclide behavior were circulated. A one-day plenary session was held Tuesday devoted to exploring current capabilities for predicting the fate of deposited radionuclides, with some special emphasis on urban environments. The traveller presented a data set derived from Hanford Site historic measurements for use as the basis for a Multiple Pathways working group validation set. This was accepted, and a scenario for distribution to the group is going to be prepared.

33845 (ETDE-IT–93-206) **Discrete stochastic models in dynamics of size-structured population.** Buffoni, G. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute); Di Cola, G. 1993. 20p. (CONF-9206358–2: 3. international conference on mathematical population dynamics, Pau (France), 1-5 Jun 1992). Order Number DE93522958. Source: OSTI; NTIS (US Sales Only).

The dynamics of a size-structured population is described as a generalized nonlinear Leslie model, through a discrete analog of the forward Kolmogorov equation. The steady state solution of a difference equation system is the positive eigenvalutation corresponding to the unit eigenvalue of a nonlinear eigenvalue problem in k_n. Necessary and sufficient conditions of the existence and uniqueness of the steady state solutions are given. An algorithm for computing this solution is described. Local stability around the equilibrium was also studied. As a case study, an application to a red coral population is considered.

33846 (FEMP/SUB–066) **Electrofishing survey of the Great Miami River, September 1992: Annual report.** Miller, M.C. (Cincinnati Univ., OH (United States). Dept. of Biological Sciences); Bixby, R.; Engman, J.; Ross, L.; Stocker, L. Westinghouse Environmental Management Co. of Ohio, Cincinnati, OH (United States). Fernald Environmental Management Project; Cincinnati Univ., OH (United States). Dept. of Biological Sciences. Mar 1993.

78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21600. Order Number DE93015654. Source: OSTI; NTIS; GPO Dep.

At the end of summer in 1992 the fishery of the Great Miami River took an unexpected deviation from the stasis of past years as an intense suspended algal bloom decreased the compositional diversity found at the lower GMR stations. Daytime supersaturation of oxygen and elevated pHs, reaching 9 by midday during the month of August, undoubtedly caused severe deficits of oxygen at night. Despite the aeration at every riffle, the intensities of the biological processes in the water were sufficient to cause very high positive and negative excursions of oxygen over the day and night cycle. This report documents a fish harvest that was conducted as part of the oxygen excess/deficit study.

33847 (INIS-JP–008, pp. 484-491) **Radioecological studies in the marine environment.** Suzuki, Y. (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Nakamura, K.; Nakamura, R.; Nakahara, M.; Ishii, T.; Matsuba, M.; Nagaya, Y. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Man-made radionuclides released into the marine environment have been regarded as useful tracers in the study of natural geochemical and oceanographic processes occurring in the ocean. Quantitative collection of Cs-137 from surface seawater by copper ferrocyanide-anion exchange resin was examined and the same method was also applied to open ocean sea water. To get inherent bioconcentration coefficients of marine fish from the coastal seas of Japan, laboratory tracer experiments using some radioisotopes were carried out. Uptake, through both radioactive seawater and food, and excretion of radionuclides by marine fish were observed for about 8 weeks. The results showed that seawater and food equally contribute to accumulation of Cs-137 by fish. The adult rockfish and Japanese flounder seemed to take up Ru-103 mainly from seawater, while juvenile fish take it from seawater and food equally. Much information on concentrations, distributions and chemical forms of stable isotopes in marine organisms is important to predict the behaviour of radionuclides in the sea or to study metal metabolism in the body of marine organisms. Approximately 40 elements corresponding to important radionuclides in more than 300 species of marine organisms, collected off the coast of Japan, were analyzed with ICP-AES, ICP-MS and electron probe X-ray microanalysis. The concentrations of Mn and Zn in the dried granules of the kidney of a marine bivalve were 44,200 and 22,800 μg/g, respectively. The high accumulation of certain elements in the kidney resulted from the existence of metal containing granules. (author).

33848 (LBL–32837) **Spatial and temporal variations in toxicity in a marsh receiving urban runoff.** Katznelson, R.; Jewell, W.T.; Anderson, S.L. Lawrence Berkeley Lab., CA (United States). Jun 1993. 66p. Sponsored by California State Government, Sacramento, CA (United States). DOE Contract AC03-76SF00098. Order Number DE93019099. Source: OSTI; NTIS; GPO Dep.

This project is composed of two sections. The first section describes dry weather toxicity surveys to evaluate the distribution of toxicity in the waters of San Francisco Bay and adjacent wetland habitat, and the second is a series of wet weather toxicity studies with emphasis on a marsh receiving urban runoff. The dry weather studies are reported in the appendices, while the wet weather work comprises the main report.

33849 (LBL–33532) **Hydrological and geochemical investigations of selenium behavior at Kesterson Reservoir: Annual report, October 1, 1990–September 30, 1992.** Benson, S.M.; Tokunaga, T.; Zawislanski, P.; Wahl, C.; Johannis, P.; Zavarin, M.; Yee, A.; Tsao, L.; Phillips, D.; Ita, S. Lawrence Berkeley Lab., CA (United States). Dec 1992. 242p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93016714. Source: OSTI; NTIS; GPO Dep.

This report describes work carried out at Kesterson Reservoir by scientists and engineers from Lawrence Berkeley Laboratory over the two-year period from October 1990 to September 1992. Efforts described in this report include the following: Results from vadose zone monitoring of selenium and salt transport at numerous locations throughout Kesterson Reservoir; Quantitative analysis of the biogeochemical evolution of selenium in surfaces soils at Kesterson, including discussion of implications for biological exposure to selenium; Measurement and analysis of the first two comprehensive data sets on soil and groundwater quality on the former Frauds Ranch; Preliminary results from the pilot-scale selenium volatilization experiment in Pond 2; Evaluation of the rates of selenium transformation from one species to another based on laboratory experiments; Data on water quality in surface water pools that formed from ponded rainwater during the winters of 1990–1991 and 1991–1992; and Quality control and assurance statistics on our analytical laboratory.

33850 (LBL–34076) **Computeer-based decision support tools for evaluation of actions affecting flow and water quality in the San Joaquin Basin.** Quinn, N.W.T. Lawrence Berkeley Lab., CA (United States). Jan 1993. 136p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93018597. Source: OSTI; NTIS; GPO Dep.

This document is a preliminary effort to draw together some of the important simulation models that are available to Reclamation or that have been developed by Reclamation since 1987. This document has also attempted to lay out a framework by which these models might be used both for the purposes for which they were originally intended and to support the analysis of other issues that relate to the hydrology and to salt and water quality management within the San Joaquin Valley. To be successful as components of a larger Decision Support System the models should to be linked together using custom designed interfaces that permit data sharing between models and that are easy to use. Several initiatives are currently underway within Reclamation to develop GIS - based and graphics - based decision support systems to improve the general level of understanding of the models currently in use, to standardize the methodology used in making planning and operations studies and to permit improved data analysis, interpretation and display. The decision support systems should allow greater participation in the planning process, allow the analysis of innovative actions that are currently difficult to study with present models and should lead to better integrated and more comprehensive plans and policy decisions in future years.

33851 (ORNL/TM–12235) **Pilot-scale field tests for the methanotrophic technology cometabolic bioreactor demonstration at the Oak Ridge K-25 Site.** Donaldson, T.L.; Lucero, A.J.; Jennings, H.L.; Herbes, S.E. Oak Ridge National Lab., TN (United States). Jun 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93017955. Source: OSTI; NTIS; GPO Dep.

This report describes a demonstration of cometabolic technology for bioremediation of groundwater contaminated with trichloroethylene (TCE) and other chlorinated and aromatic solvents conducted by Oak Ridge National Laboratory (ORNL). The technology demonstration is located at a seep from the K-1070-C/D Classified Burial Ground at the Oak Ridge K-25 Site. Funding for this demonstration is provided by the US Department of Energy (DOE), Environmental Restoration/Waste Management Program, Office of Technology Development.

33852 (PNL–8766) **Ecological evaluation of proposed dredged material from Wilmington Harbor and Military Ocean Terminal, Sunny Point, North Carolina.** Ward, J.A. (Battelle/Marine Sciences Lab., Sequim, WA (US)); Pinza, M.R.; Barrows, M.E.; Word, J.Q. Pacific Northwest Lab., Richland, WA (United States); Battelle/Marine Sciences Lab., Sequim, WA (United States). Jul 1993. 248p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93019600. Source: OSTI; NTIS; GPO Dep.

This report is intended to provide information required to address potential ecological effects of the proposed disposal of Wilmington Harbor and Military Ocean Terminal, Sunny Point (MOTSU), North Carolina, sediments in the ocean. The report is divided into five sections. Section 1.0 is the introduction containing a brief overview

of the study and the study objectives. Section 2.0 describes the methods and materials used for sample collection, processing, toxicological and bioaccumulation testing, physical/chemical analysis of sediments and tissues, data analysis, and quality assurance procedures. Section 3.0 presents the results of field collections, sediment chemistry, toxicological testing, and tissue chemistry resulting from bioaccumulation exposures. Section 4.0 presents a discussion of the results and summary conclusions concerning the acceptability of the Wilmington Harbor and MOTSU dredged material for ocean disposal. Section 5.0 lists the literature cited in support of this document. A series of appendixes contain detailed data listings.

33853 (SSI–93-06) **Studies on the waste depository of the Sillamaee plant.** Ehdwall, H. (Swedish Radiation Protection Inst., Stockholm (Sweden)); Sundblad, B.; Nosov, V.; Putnik, H.; Mustonen, R.; Salonen, L.; Illus, E.; Qvale, H. Swedish Radiation Protection Inst., Stockholm (Sweden). 15 Mar 1993. 12p. Order Number DE94600125. Source: OSTI; NTIS; INIS.

The studies on the waste material in the Sillamaee depository indicate that the wall material of the depository is typical mill tailing from chemical enrichment of uranium ore. The results from the sea sampling show that the impact from the depository on the marine environment is obvious close to the shore-line. However, the concentrations of radioactive elements decrease very rapidly as the distance from the shore increases.

33854 (Y–2073/R1) **Rapid determination of uranium in natural waters by thermal emission mass spectrometry: Revision 1.** Ferguson, J.R.; Caylor, J.D.; Rogers, E.R.; Cole, S.H. Oak Ridge Y-12 Plant, TN (United States). 28 Mar 1977. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (CONF-761043–1: 20. annual conference of analytical chemistry, Gatlinburg, TN (United States), 11-14 Oct 1976). Order Number DE93018592. Source: OSTI; NTIS; GPO Dep.

A six-inch radius mass spectrometer has been constructed and demonstrated to adequately analyze water samples for uranium concentrations down to 5 to 10 ng/liter (ppt). The precision and accuracy of the isotope-dilution, thermal emission method is sufficient to meet the needs of the Uranium Resources Evaluation (URE) project. A single analyst can analyze in excess of 50 samples per day, including all preparation and instrument time. This analysis rate will meet the economic constraints of the URE analytical program.

33855 (EGG–10617-2159) **Effects of military-authorized activities on the San Joaquin kit fox (Vulpes velox macrotis) at Camp Roberts Army National Guard Training Site, California.** Berry, W.H.; Standley, W.G.; O'Farrell, T.P.; Kato, T.T. EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. Oct 1992. 25p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93018483. Source: OSTI; NTIS; INIS; GPO Dep.

The effects of military-authorized activities on San Joaquin kit fox (Vulpes velox macrotis) were investigated at Camp Roberts Army National Guard Training Site from 1988 to 1991. Military-authorized activities included military training exercises, facilities maintenance, new construction, controlled burning, livestock grazing, and public-access hunting. Positive effects of the military included habitat preservation, preactivity surveys, and natural resources management practices designed to conserve kit foxes and their habitat. Perceived negative effects such as entrapment in dens, shootings during military exercises, and accidental poisoning were not observed. Foxes were observed in areas being used simultaneously by military units. Authorized activities were known to have caused the deaths of three of 52 radiocollared foxes recovered dead: one became entangled in concertina wire, one was believed shot by a hunter, and one was struck by a vehicle. Entanglement in communication wire may have contributed to the death of another radiocollared fox that was killed by a predator. Approximately 10% of kit fox dens encountered showed evidence of vehicle traffic, but denning sites did not appear to be a limiting factor for kit foxes.

33856 (DOE/ER/20015–2) **Differential regulation of plastid mRNA stability: Progress report.** Stern, D.B. Boyce Thompson Inst. for Plant Research, Ithaca, NY (United States). Environmental Biology Dept. [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER20015. Order Number DE93019889. Source: OSTI; NTIS; GPO Dep.

Our goal is to identify cis-acting sequences and transacting factors that function in plastid mRNA maturation, stabilization, and/or decay through an in vitro and in vivo analysis of mRNA:protein interactions. Our previous results emphasized the study of 3′end inverted repeat sequences (IRs) that serve both as mRNA processing elements and stability determinants, and associate with plastid proteins that potentially play enzymatic, structural and/or regulatory roles. We seek to define, by single base and internal deletion mutagenesis, the sequence and structural requirements for protein binding to the 3′ IRs of petD and psbA mRNAs; to purify RNA-binding proteins that demonstrate gene- or sequence-specific binding, or that are implicated in RNA stabilization or decay; and to investigate the native form of mRNA in the plastid, by attempting to purify ribonucleoprotein (RNP) particles from organelles. Our view of mRNA decay is that it is regulated by three interactive components: RNA structure, ribonucleases and RNA-binding proteins. We have used mutagenesis to study the role of RNA structure in regulating RNA decay rates, and to identify protein binding and endonuclease recognition sites. We have identified at least three endonuclease activities; one that cleaves psbA RNA; and two whose cleavage patterns with petD 3′ IR-RNA has been studied (endoC1 and endoC2). Additionally, we have continued to analyze the properties of the major RNA processing exoribonuclease. We have concentrated our efforts on three RNA-binding proteins. A 100 kd protein with properties suggestive of a mammalian RNP component has been purified. A protein of 55 kd that may also be an endonuclease has been partially purified. We have studied the interaction of a 29 kd protein with the petD stem/loop, and its role in RNA processing. Recently, we have used a novel gel shift/SDS-PAGE technique to identify new RNA-binding proteins.

33857 (DOE/ER/20055–4) **Transport function and reaction mechanism of vacuolar H^+- translocation inorganic pyrophosphatase: Annual technical progress report.** Pennsylvania Univ., Philadelphia, PA (United States). Dept. of Biology. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER20055. Order Number DE93019884. Source: OSTI; NTIS; GPO Dep.

These studies describe progress made in the definition of the transport capabilities and reaction mechanism of the V-PPase through biochemical analyses of native membrane vesicles isolated from etiolated hypocotyls of Vigna radiate and by reconstitution of the purified enzyme into artificial liposomes; delineation of the ligand requirements of the V-PPase; and the delineation of sequence motifs implicated in substrate-binding through the development of strategies for selective cleavage of the M_r 66,000 polypeptide and the mapping of covalently modified peptide fragments.

33858 (DOE/ER/61235–T1) **[Nonhomologous mechanisms of repair of chromosomal breaks]: Progress report.** Haber, J.E. Brandeis Univ., Waltham, MA (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61235. Order Number DE93019986. Source: OSTI; NTIS; GPO Dep.

Broken chromosomes must either be repaired or lost. The break separates part of the chromosome, containing a telomere, from the

rest, containing a centromere. While the centromerecontaining fragment can properly segregate, the broken end will be progressively degraded. The acentric fragment cannot segregate and will also be degraded. We have centered our attention on two alternative nonhomologous mechanisms of repair: (1) the acquisition of a new telomere, and (2) repair of broken chromosomes by nonhomologous joining of broken chromosome ends. In both cases, we create a double-strand break at a defined chromosomal location in yeast cells. The break is created by the site-specific HO endonuclease in cells that carry the rad52 mutation to prevent repair of a double-strand break by homologous recombination. In diploid cells, we can recover cells that contain a terminally deleted, healed chromosome that has acquired a new telomere. In haploid cells, we can recover cells in which the double-strand break has been repaired by rejoining the broken ends, usually accompanied by a deletion.

33859 (SAND–93-8233) **A numerical study of hybrid optimization methods for the molecular conformation problems.** Meza, J.C.; Martinez, M.L. Sandia National Labs., Albuquerque, NM (United States). May 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93017898. Source: OSTI; NTIS; GPO Dep.

An important area of research in computational biochemistry is the design of molecules for specific applications. The design of these molecules depends on the accurate determination of their three-dimensional structure or conformation. Under the assumption that molecules will settle into a configuration for which their energy is at a minimum, this design problem can be formulated as a global optimization problem. The solution of the molecular conformation problem can then be obtained, at least in principle, through any number of optimization algorithms. Unfortunately, it can easily be shown that there exist a large number of local minima for most molecules which makes this an extremely difficult problem for any standard optimization method. In this study, we present results for various optimization algorithms applied to a molecular conformation problem. We include results for genetic algorithms, simulated annealing, direct search methods, and several gradient methods. The major result of this study is that none of these standard methods can be used in isolation to efficiently generate minimum energy configurations. We propose instead several hybrid methods that combine properties of several local optimization algorithms. These hybrid methods have yielded better results on representative test problems than single methods.

33860 (UCRL-ID–133636) **Sperm cells as vectors in the production of transgenic animals.** Prince, R.M. Lawrence Livermore National Lab., CA (United States). 28 Apr 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93017963. Source: OSTI; NTIS; GPO Dep.

Transgenic animals are used in industry and in biomedical research in order to provide in vivo experimental model systems. Sperm cells have been reported used as vectors in the production of transgenic animals before, however no approach has of yet proven to be successful. Fertilizing eggs with genetically modified sperm would be advantageous in that sperm are readily accessible and stable, and eggs can be fertilized by modified sperm cells in vivo. Recent elucidations regarding the unique manner of DNA packaging in sperm chromatin by protamines has provided us with the insight for developing a method of introducing foreign DNA into sperm which is likely to succeed where others have failed. We have developed a method for mimicking the in vivo system of sperm chromatin toroid subunits in vitro, concentrating these toroids, and fluorescent visualization. Our present work concerns development of a method to successfully deliver DNA across the cell membranes and into the nucleus.

33861 (DOE/ER/20008–2) **Regulation of cell division in higher plants: Progress report, 1993.** Jacobs, T. Illinois Univ., Chicago, IL (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER20008. Order Number DE93040691. Source: OSTI; NTIS; GPO Dep.

Recent work on the project has been focused almost exclusively on obtaining and characterizing CDNA clones encoding cylcin-dependent kinases (CDK), and cycling from pea. All of our work up to this time has relied on small PCR-generated CDNA clones of 2 putative pea CDKs and a putative pea mitotic cyclin, as well as anti-CDK antibodies of poor affinity and questionable specificity. Therefore, it has become a high priority for us to generate clones, probes and immunological tools in our own system. As of this writing, we have four putative CDKs (CdkPsl,2,3,& 4) and five putative cyclins (Cyc-Ps1,2,3,4,& 5), the DNA sequences of which have been determined to varying degrees of completeness.

33862 (CONF-8905192–4-App.A) **Genome sequencing by direct imaging x-ray color holography: Appendix A.** Haddad, W. (MCR Technology Corp., Chicago, IL (United States)); Boyer, K.; Solem, J.C.; Rhodes, C.K.; Moriarty, R.M. MCR Technology Corp., Chicago, IL (United States). [1989]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER60898 ;FG02-86ER13610. From Conference on X-ray microimaging for the life sciences; Berkeley, CA (United States); 24-26 May 1989. Order Number DE93017913. Source: OSTI; NTIS; INIS; GPO Dep.

Currently available techniques for sequencing DNA are inadequate for oligonucleotides of length greater than 600 nucleotides and are most effective in the 300 nucleotide range. Automated sequencers are now available which use, basically, the Sanger dideoxy termination method. The sequencing rates of these conventional methods are extremely low and involve very labor intensive procedures, requiring on the order of two man-years of effort for the determination of the sequence of a single 100 kilobase segment. Since the full human genetic complement is of vast size, representing $\sim 3 \times 10^9$ bases, a fast and accurate method for DNA sequencing is needed. Therefore, we set as a goal a sequencing rate in the range of $\sim 10^2$ bp/s with an accuracy of ~ 1 error per 10^6 bases, a value exceeding that set by the fidelity of current enzymatic processes. These values would permit the accurate determination of the sequence of the full human genome in one year. An approach involving rapid direct imaging of large segments of DNA is desired. A properly constructed x-ray Fourier-transform holographic microscope appears to combine these features. A basic x-ray holographic instrument has been designed. This concept, with appropriate modifications, and the use of presently available x-ray sources, appears applicable to the task of genome sequencing with a resulting rate of sequence determination in the range of $\sim 10^2$ bp/s.

This report presents summaries for two months of current research of the Idaho National Engineering Laboratory Boron Neutron Capture Therapy Program. Information is presented on development and murine screening experiments of low-density lipoprotein, carboranyl alanine, and liposome boron containing compounds. Pituitary tumor cell culture studies are described. Drug stability, pharmacology and toxicity evaluation of borocaptate sodium and boronophenylalanine are described. Treatment protocol development via the large animal (canine) modal studies and physiological response evaluation in rats are discussed. Supporting technology development and technical support activities for boron drug biochemistry and purity, analytical and measurement dosimetry, and noninvasive boron quantification activities are included for the current time period. Current publications for the two months are listed.

33866 (LA-UR–93-2764) **Optical diagnostics based on elastic scattering: Recent clinical demonstrations with the Los Alamos Optical Biopsy System.** Bigio, I.J. (Los Alamos National Lab., NM (United States)); Loree, T.R.; Mourant, J.; Shimada, T.; Story-Held, K.; Glickman, R.D.; Conn, R. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93018289. Source: OSTI; NTIS; GPO Dep.

A non-invasive diagnostic tool that could identify malignancy in situ and in real time would have a major impact on the detection and treatment of cancer. We have developed and are testing early prototypes of an optical biopsy system (OBS) for detection of cancer and other tissue pathologies. The OBS invokes a unique approach to optical diagnosis of tissue pathologies based on the elastic scattering properties, over a wide range of wavelengths, of the microscopic structure of the tissue. The use of elastic scattering as the key to optical tissue diagnostics in the OBS is based on the fact that many tissue pathologies, including a majority of cancer forms, manifest significant architectural changes at the cellular and sub-cellular level. Since the cellular components that cause elastic scattering have dimensions typically on the order of visible to near-IR wavelengths, the elastic (Mie) scattering properties will be strongly wavelength dependent. Thus, morphology and size changes can be expected to cause significant changes in an optical signature that is derived from the wavelength dependence of elastic scattering. The data acquisition and storage/display time with the OBS instrument is ~1 second. Thus, in addition to the reduced invasiveness of this technique compared with current state-of-the-art methods (surgical biopsy and pathology analysis), the OBS offers the possibility of impressively faster diagnostic assessment. The OBS employs a small fiber-optic probe that is amenable to use with any endoscope, catheter or hypodermic, or to direct surface examination (e.g. as in skin cancer or cervical cancer). It has been tested in vitro on animal and human tissue samples, and clinical testing in vivo is currently in progress.

33867 (ORNL/TM–12411) **Nuclear Medicine Program progress report for quarter ending June 30, 1993.** Knapp, F.F. Jr.; Ambrose, K.R.; Beets, A.L.; Callahan, A.P.; Hsieh, B.T.; McPherson, D.W.; Mirzadeh, S.; Lambert, C.R. Oak Ridge National Lab., TN (United States). Jul 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93018493. Source: OSTI; NTIS; GPO Dep.

The "IQNP" agent is an antagonist for the cholinergic-muscarinic receptor. Since the IQNP molecule has two asymmetric centers and either cis or trans isomerism of the vinyl iodide, there are eight possible isomeric combinations. In this report, the systematic synthesis, purification and animal testing of several isomers of radioiodinated "IQNP" are reported. A dramatic and unexpected relation between the absolute configuration at the two asymmetric centers and the stereochemistry of the vinyl iodide on receptor specificity was observed. The E-(R)(R) isomer shows specific and significant localization (per cent dose/gram at 6 hours) in receptor-rich cerebral structures (i.e. Cortex = 1.38 + 0.31; Striatum = 1.22 + 0.20) and low uptake in tissues rich in the M_2 subtype (Heart = 0.10; Cerebellum = 0.04). In contrast, the E-(R)(S) isomer shows very low receptor-specific uptake (Cortex = 0.04; Striatum = 0.02), demonstrating the importance of absolute configuration at the acetate center. An unexpected and important observation is that the stereochemistry of the vinyl iodine appears to affect receptor subtype specificity, since the Z-(R,S)(R) isomer shows much higher uptake in the heart (0.56 + 0.12) and cerebellum (0.17 + 0.04). Studies are now in progress to confirm these exciting results in vitro. Progress has also continued during this period with several collaborative programs. The first large-scale clinical tungsten-188/rhenium-188 generator prototype (500 mCi) was fabricated and supplied to the Center for Molecular Medicine and Immunology (CMMI), in Newark, New Jersey, for Phase I clinical trials of rhenium-188-labeled anti CEA antibodies for patient treatment. Collaborative studies are also continuing in conjunction with the Nuclear Medicine Department at the University of Massachusetts where a generator is in use to compare the biological properties of "direct" and "indirect" labeled antibodies.

33868 (UCRL-CR–114236) **Malignant melanoma slide review project: Patients from non-Kaiser hospitals in the San Francisco Bay Area: Final report.** Reynolds, P. (California Dept. of Health Services, Berkeley, CA (United States)). Lawrence Livermore National Lab., CA (United States). 5 Jan 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (LLNL–1A1503). Order Number DE93019116. Source: OSTI; NTIS; GPO Dep.

This project was initiated, in response to concerns that the observed excess of malignant melanoma among employees of Lawrence Livermore National Laboratory (LLNL) might reflect the incidence of disease diagnostically different than that observed in the general population. LLNL sponsored a slide review project, inviting leading dermatopathology experts to independently evaluate pathology slides from LLNL employees diagnosed with melanoma and those from a matched sample of Bay Area melanoma patients who did not work at the LLNL. The study objectives were to: Identify all 1969–1984 newly diagnosed cases of malignant melanoma among LLNL employees resident in the San Francisco-Oakland Metropolitan Statistical Area, and diagnosed at facilities other than Kaiser Permanente; identify a comparison series of melanoma cases also diagnosed between 1969–1984 in non-Kaiser facilities, and matched as closely as possible to the LLNL case series by gender, race, age at diagnosis, year of diagnosis, and hospital of diagnosis; obtain pathology slides for the identified (LLNL) case and (non-LLNL) comparison patients for review by the LLNL-invited panel of dermatopathology experts; and to compare the pathologic characteristics of the case and comparison melanoma patients, as recorded by the dermatopathology panel.

33869 (UCRL-ID–113760) **Signal processing of Shiley heart valve data for fracture detection.** Mullenhoff, C. Lawrence Livermore National Lab., CA (United States). 1 Apr 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018908. Source: OSTI; NTIS; GPO Dep.

Given digital acoustic data emanating from the heart sounds of the beating heart measured from laboratory sheep with implanted Bjoerk-Shiley Convexo-Concave heart valves, it is possible to detect and extract the opening and closing heart beats from the data. Once extracted, spectral or other information can then obtained from the heartbeats and passed on to feature extraction algorithms, neutral networks, or pattern recognizers so that the valve condition, either fractured or intact, may be determined.

33870 (UCRL-ID–114802) **Detection of "single-leg separated" heart valves using statistical pattern recognition with the nearest neighbor classifier.** Buhl, M.R.; Clark, G.A.; Candy, J.V.; Thomas, G.H. Lawrence Livermore National Lab., CA (United States). 16 Jul 1993. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018911. Source: OSTI; NTIS; GPO Dep.

The goal of this work was to detect "single-leg separated" Bjoerk-Shiley Convexo-Concave heart valves which had been implanted in sheep. A "single-leg separated" heart valve contains a fracture in the outlet strut resulting in an increased risk of mechanical failure. The approach presented in this report detects such fractures by applying statistical pattern recognition with the nearest neighbor classifier to the acoustic signatures of the valve opening. This approach is discussed and results of applying it to real data are given.

33871 (AECS-A/FRSR–69) **Feasibility for the disinfestation of pulses and cereal grains by irradiation.** Mansour, M.Y. (Atomic Energy Commission, Damascus (Syrian Arab Republic). Dept. of Radiation Agriculture); Al-Bachir, M. Atomic Energy Commission, Damascus (Syrian Arab Republic). May 1993. 16p. (CONF-9303213–: 3. research coordination meeting on food irradiation program for the Middle East and European countries, Cadarache (France), 8 Mar 1993). Order Number DE94600170. Source: OSTI; NTIS (US Sales Only); INIS.

The faba bean seed beetle,Bruchus Dentipes Baudi, the lentil seed beetle, B.ervi Froel, and the European lentil seed beetle, B.lentis Froel are the most important insect pests of lentil and faba bean in Syria. Adults lay their eggs on the green pods in the field and immature stages develop inside the seeds. Infestation rate differs from year to year and from one location to another. In 1991, it ranged between 9.6 and 13.90 for lentil seeds and 31.00 to 57.39% for faba bean seeds depending on the region. This reduced the economic value by about 50% for faba bean seeds and 20 - 30% for lentil seeds. Current disinfestation methods are unsafe and not adequately effective. Ionizing radiation could be an alternative approach. An investigation was initiated to determine the possibility of applying the irradiation disinfestation technique against these pests. The dose of gamma radiation needed for disinfecting faba bean seeds infested with B.Dentipes was found to be 90 Gy for the last two larval instars. Immature stages of B.ervi and B.lentis develop very rapidly in the field and reach the pupal or adult stage by harvest. This makes the application of this technique for disinfecting lentil seeds of little or no value. However, the results indicate that the irradiation disinfestation method could be an advantageous approach for disinfecting faba bean seeds. (author). 38 refs., 4 tabs., 1 fig.

A three-year Co-ordinated Research Program on "Immunoassay techniques to improve the reproductive efficiency and health status of indigenous African livestock" was funded from November 1986, and in March 1990 the Program was extended for a further three years with the title "Improving the productivity of indigenous African livestock through integrated studies on smallholder farms, and the use of improved methods for diagnosing and controlling trypanosomiasis". This article summarizes the work performed under the two Programs. 6 refs, 1 fig., 2 tabs.

33875 (IAEA-TECDOC–708, pp. 31-38) **Factors affecting the reproductive performance of Bunaji cattle under different pastoral management systems in the Guinea savanna zone of Nigeria.** Eduvie, L.O. (Ahmadu Bello Univ., Zaria (Nigeria). National Animal Production Research Inst.); Bawa, E.K.; Dawuda, P.M.; Oyedipe, E.O.; Olorunju, S.A.S.; Bales, J.O.; Sekoni, V.O. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

The effects of management on the productivity of Bunaji cattle were investigated on 6 farms using 38 post-partum cows and 8 heifers. General information obtained on management of the farms indicated differences in managements practices between farms. The screening of the animals in the various farms for blood and endo-parasites showed that some of the farms had problems of helminthiasis and fascioliasis. Uterine involution was complete within 25 days of calving in all post-partum cows. Intervals from calving to ovulation and conception were different between farms. The conception rates for all farms over a period of 730 days ranged from 60 to 100%. A higher percentage of heifers on farm A reached puberty at an earlier age than those in farm B. It was concluded that management affects reproductive performance and

thus productivity of Bunaji cattle, with nutrition and disease being the major contributing factors. (author). 10 refs, 7 tabs.

33876 (IAEA-TECDOC–708, pp. 39-47) **Growth and first ovulations of Santa-Gertrudis heifers in Morocco.** Haddada, B. (Institut Agronomique et Veterinaire Hassan II, Rabat (Morocco). Dept. de Reproduction Animale); Lahlou Kassi, A.; Tibary, A.; Thibier, M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. (In French). In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this study was to study the variations in body weight and rate of cyclicity during the 7 months prior to the mating season (September - January), and to study the effects of these variations on the fertility of Santa-Gertrudis heifers kept under a "Ranching" management system. A total of 91 heifers divided into 2 groups, 47 females born in December - January (early) and 44 born in March (late), were included in the study. The animals were weighed and blood sampled for the assay of progesterone weekly. Two months after the end of the mating season pregnancy was diagnosed by rectal palpation. The study demonstrated a highly significant ($P < 0.001$) influence of season of birth on body weight. In the early heifers a significant loss ($P < 0.001$) in body weight and a decrease in rate of cyclicity were observed between July and November. The average body weight decreased from 298 $\pm$ 3.1 kg(X-bar $\pm$ s.e.m.) to 272 $\pm$ 2.8 kg and the percentage of animals cycling decreased from 75% to 57% in this period. Between November and January, the early heifers showed a significantly ($P < 0.001$) higher increase in body weight than the late heifers. In January the average body weight and rate of cyclicity of all heifers was 288 $\pm$ 3.8 kg and 65% respectively. The animals cycling at the beginning of the mating season (15 January) showed a higher body weight gain ($P < 0.05$) than the non-cycling ones. Fifty five percent of the heifers were found pregnant by rectal palpation. In addition, the pregnant animals showed a significantly ($P < 0.05$) higher body weight gain than the non-pregnant animals during the period November-February. These results indicate that variations in body weight and rate of cyclicity do not allow an optimal conception rate of 80%. (author). 16 refs, 4 figs, 4 tabs.

33877 (IAEA-TECDOC–708, pp. 49-57) **Reproductive performance of Tanzanian Mpwapwa cattle at puberty and post-partum.** Kanuya, N.L. (Sokoine Univ. of Agriculture, Morogoro (Tanzania). Dept. of Veterinary Surgery, Obstetrics and Reproduction); Nkya, R.; Kessy, B.M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. Contract IAEA-R-4976/NL. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

Twenty on Mpwapwa heifers between 1 and 1.5 years of age were included in an experiment to determine age and weight at puberty. Background information about the animals was obtained from farm records. The animals were weighed at specific intervals. Weekly blood samples for progesterone concentration determination were obtained by jugular venipuncture. Twenty two cows of the same breed were included in another experiment to determine the length of post-partum acyclic period. Cows in oestrus were naturally bred. Starting from the first week of calving, blood samples for progesterone determination were obtained on a weekly basis until the cows were diagnosed pregnant. Seventeen heifers attained puberty at an average age of 916 $\pm$ 106 (mean $\pm$ sd) days. The range was between 742 and 1123 days. Heifers born in the dry season reached puberty at a later age ($P < 0.01$) than those born in the wet season but all attained similar bodyweight (215 $\pm$ 17) kg when ovarian cycles commenced. The mean interval between calving and initiation of ovarian activity was 104 $\pm$ 50 days. Fifteen out of 19 cows conceived again during the period under study, the mean interval between calving and conception was 158 $\pm$ 86 days. It can be concluded that Mpwapwa heifers reach puberty at an advanced age and cows of the same breed have a long post-partum acyclic period. Strategies such as dry season supplementary feeding should be implemented to improve reproductive performance. (author). 32 refs, 1 fig., 3 tabs.

33878 (IAEA-TECDOC–708, pp. 59-66) **Studies on the influence of nutrition before and after lambing on the response of barbary ewes to the "ram effect" in Tunisia.** Lassoued, N. (INRAT, Ariana (Tunisia). Lab. des Recherches Ovine et Caprines); Khaldi, G. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. (In French). In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this work was to study the effect of the nutritional level during the last 12 weeks of pregnancy and the first 18 weeks of lactation on the response of Barbary ewes of the "ram effect", in spring. The experiment was conducted on 140 adult females divided, according their nutritional level during pregnancy, into 2 groups H (High) and L (Low) and into 4 groups HH (High pregnancy, High Lactation), HL (High pregnancy, Low Lactation), LH (Low pregnancy, High Lactation) and LL (Low pregnancy, Low Lactation), during lactation. The ewes were mated by rams of the same breed. The ovarian activity of ewes was controlled by coelioscopy at Day-1 Day+4, Day+9, and some days after the first oestrus. The results of this study showed that the response of ewes to the "ram effect" was not related to their nutritional level during pregnancy and lactation, provided they were well fed between weaning of lambs and mating. In fact, the introduction of rams into the flock induced ovulation in all of the ewes. However, undernutrition during pregnancy and/or lactation decreased the percentage of cycling females before teasing (HL:31%, LH:35%, LL:33%) in comparison with the well fed ewes (HH:66%) and increased the proportion of the short induced ovarian cycles (HL:67%, LH:75%, LL:79%, against only 45% in the HH group). The effect of flushing on the ovulation rate was shown in the LL group which had the highest ovulation rate (1.79) in comparison with the other groups. On the other hand, teasing had a similar effect to flushing since the induced ovulation rate was higher than that of the following ovulations. (author). 18 refs, 2 figs, 5 tabs.

33879 (IAEA-TECDOC–708, pp. 67-72) **Effect of progesterone on the ram-induced corpus luteum life span in the barbary ewe in Tunisia.** Lassoued, N. (INRAT, Ariana (Tunisia). Lab. des Recherches Ovines et Caprines); Khaldi, G. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. (In French). In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

Ovulation is induced in seasonal anestrous Barbary ewes by using the "ram effect". Heats induced by this technique are distributed over 10 days (between day 13 and 23). The existence of short ovarian cycles following the induced ovulation is responsible for this dispersion of oestrus. The aim of this work is to improve the natural technique of the "male effect" by associating it to a progestative treatment leading to a better synchronization of heats. Thirty adult Barbary ewes were distributed into 2 groups: 1) a control group ("ram effect"); and 2) a treated group ("ram effect + 20 mg of progesterone). This injection of progesterone did not affect the response to the "male effect" since all treated ewes ovulated during the first 4 days after the introduction of rams. Moreover, this treatment prevented the occurrence of the short ovarian cycles. The preovulatory LH surge occurred 20.5 $\pm$ 10.78 and 58.9 $\pm$ 10.10 hours after the introduction of males in the control and treated groups respectively. Thus progesterone delayed the preovulatory surge of LH. This result suggests that this hormone induces normality of corpora lutes by lengthening the period of gonadotrophin priming of follicules before ovulation, or progesterone may affect the preovulatory follicles directly. Moreover, the effect of treatment on the distribution of oestrus was effective. The heats were synchronized during 3 days (between days 17 and 20 after the introduction of males). Even though this distribution was dispersed in the control group (between days 14 and 23). (author). 17 refs, 2 figs, 1 tabs.

33880 (IAEA-TECDOC–708, pp. 73-80) **Reproductive performance of Zambian goats under drought conditions.** Lovelace, C.E.A. (Zambia Univ., Lusaka (Zambia). Samora Machel School of Veterinary Medicine); Masebe, P.O.C.S.; Sakala, B.; Nyirenda, I.;

Sikazwe, G.; Mizinga, K.M.; Lungu, J.C.N. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

Goats play a very important role in integrated farming in Zambia. Two surveys of husbandry practices in Gwembe Valley and Siavonga District, Southern Province, were carried out. Herd sizes varied from 3 to 300 goats with a buck:doe ratio of 1:18. In two separate experiments, serum progesterone levels were measured in goats on-station to determine the duration of the oestrus cycle. This duration varied between 10 and 26 days. The average duration of the oestrus cycle was 17.6 and 19.8 days in the first and second experiment respectively. A survey including over 60 goats belonging to 10 farmers in Lusitu, Siavonga District, is being undertaken. The region has suffered a severe drought, but the goats has showed no loss in weight and have maintained total serum protein and blood cell levels. (author). 14 refs, 1 fig., 3 tabs.

33881 (IAEA-TECDOC–708, pp. 73-80) **Studies on cyclic ovarian activity in pre-puberal heifers and post-partum cows of the Gobra Zebu breed in Senegal.** Mbaye, M. (Laboratoire National d'Elevage et de Recherches Veterinaires, Dakar-Hann (Senegal)); Ndiaye, M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. (In French). In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this study was to determine the age at the onset of puberty in heifers, and the resumption of ovarian activity post-partum in cows of the Gobra Zebu breed. The study was conducted at the Centre de Recherches Zootechniques (CRZ) in Dahra. The CRZ is located in the sylvo-pastoral zone of Senegal. The female offspring were kept with their mothers until weaning at an age of 7 months. After this age they were grazed on natural pasture with ad-lithium watering. The heifers and cows were monitored for 14 and 4 months respectively. This monitoring included the detection oestrous behaviour, weighing, and RIA of progesterone in blood plasma. The heifers showed an average daily weight gain of 418 and 235 g/d prior to and after weaning respectively. An an age of 14 months, 17 of the 21 heifers had shown signs of oestrus behaviour at least once. The average age at first plasma progesterone rise was 413 $\pm$ 64 days(X-bar $\pm$ sem) with and average body weight of 176 $\pm$ 22.2 kg. This age is correlated with the body weight at weaning. In cows the resumption of ovarian activity post-partum proceeded progressively. Based on heat observations, 4 and 6 out of 13 cows resumed ovarian activity 50 and 60 days post-partum respectively. Based on plasma progesterone levels, resumption of ovarian activity occurred between 36 and 48 days post-partum in 7 out of the 13 animals. Other data collected showed that Gobar Zebu cattle have a late age at first calving (51 months) and long calving intervals (430 to 530 days). This study shows that the Zebu Gobra can commence cyclic ovarian activity at an early age, and that the duration of post-partum acyclicity can be short. This allows the development of strategies to improve the productivity of Zebu Gobra cattle. (author). 41 refs, 3 figs, 1 tab.

33882 (IAEA-TECDOC–708, pp. 91-102) **Improving the productivity of indigenous goats in Zimbabwe.** Ndlovu, L.R. (Zimbabwe Univ., Harare (Zimbabwe). Dept. of Animal Science); Sibanda, L.M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

The productivity of indigenous goats was monitored in two areas which are situated in semi-arid regions of Zimbabwe. Both had low and erratic rainfall (400-600 mm per year) and three seasons were identified: hot wet (November to March), cool dry (April to July) and hot dry (August to October). Goats had long kidding intervals (370 d and 311 d, respectively), had slow growth rates (45 and 50 g/d) and high mortalities (41% and 36% by weaning age) in both areas. Seasonal effects were prominent for all production parameters but there was no season that consistently improved the productivity of goats. In one of the areas which had the highest incidence of births during the dry season, feed availability was the major constraint. An on-station feeding trial with pregnant does was carried out to investigate the effect of improved doe nutrition on kid performance. Does were offered three levels of feeding, High, Medium and Low pre-partum and does on each level were further allocated to either high or low feeding level post-partum. Pre-partum feeding levels did not affect kid birth weight (mean 3.0 kg), but improved doe live-weight at parturition. Post-partum feeding increased kid growth rate up to 42 d post-partum but had no effect on subsequent growth up to 105 d which was approximately 90 g/d. This growth rate was double that observed in communal area flocks. Strategic supplementation would improve productivity of indigenous goats in smallholder farming systems in Zimbabwe. (author). 13 refs, 4 figs, 8 tabs.

33883 (IAEA-TECDOC–708, pp. 103-112) **Studies on the reproductive performance of indigenous beef cattle breeds raised on-farm in Ghana.** Osei, S.A. (University of Science and Technology, Kumasi (Ghana). Dept. of Animal Science); Karikari, P.K.; Tuah, A.K.; Gyawu, P.; Opoku, R.S.; Asiama, M.; Heathcote, D.C. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. Contract IAEA-R-4825/NL. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

Studies were undertaken to investigate the reproductive performance of a mixture of N'dama and West African Shorthorn (N'dama/WASH) and Sanga cattle raised under traditional management conditions on four privately owned small-holder farms. The first study involved an analysis of reproductive records and the measurement of plasma progesterone concentration to delineate the onset of various reproductive phenomena, including age at puberty and first calving, post-partum resumption of ovarian activity and other abnormal events like abortions. The second study investigated the influence of dry-season feed supplementation on reproductive performance. In study 1 the ages at first plasma progesterone rise (puberty), first mating and first calving for N'dama/WASH cattle on three farms averaged 981, 1016 and 1296 days respectively. The calving interval, calving-to-progesterone rise and calving-to-mating averaged 412, 129 and 114 days respectively. Significant differences existed among farms with Farms 1 and 2 out-performing Farm 3. The respective mean ages at first progesterone elevation, first mating and first calving for Sanga cattle (Farm 4) were 964, 990 and 1271 days while calving-to-progesterone rise, calving-to-mating and calving intervals averaged 107, 150 and 431 days. In study 2, dry-season feed supplementation generally reduced ages at puberty and first calving as well as the interval of post-partum acyclicity. (author). 18 refs, 3 figs, 9 tabs.

33884 (IAEA-TECDOC–708, pp. 121-126) **Breeding soundness and its relevance to the AI-bulls.** Thibier, M. (UNCEIA, Maisons-Alfort (France). Lab. de Controle des Reproducteurs). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. (In French). In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

The present review indicates some of the conditions following which an accurate evaluation of the breeding soundness of young post-pubertal bulls can be made. This relies on the following components: sexual behaviour, testis morphology, sperm production, hormonal profiles, semen output. A combination of these traits results in discarding up to 20 - 25% of the bulls prior to their entry into AI centers. This finally results in contributing to improve the mean potential of fertility in a given population hence giving an additional advantage to this remarkable technique, namely Artificial Insemination. (author). 9 refs, 3 figs, 2 tabs.

33885 (IAEA-TECDOC–708, pp. 127-131) **Pathophysiology, diagnosis and therapy of ovarian disorders post-partum in dairy cattle.** Willemse, A.H. (Utrecht Univ., Utrecht (Netherlands). Dept. of Herd Health and Reproduction). Joint FAO/IAEA Div. of

Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

The neuroendocrine events leading to the development of a dominant follicle and ovulation are described, and pathogenesis, clinical symptoms, diagnosis and therapy of cystic ovarian disease discussed. In addition, descriptions of follicular growth and endocrine changes in post-partum cows, reasons for prolonged post-partum acyclicity, and hormonal methods to induce first oestrus and ovulation are given. (author). 8 refs.

33886 (IAEA-TECDOC–708, pp. 133-142) **Productivity and ovarian activity of Peul sheep under indigenous management in Niger.** Yenikoye, A. (Niamey, Univ., Niamey (Niger). Faculte d'Agronomie); Marichatou, H. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. (In French). Contract IAEA-R-4864/NL. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

Parameters of reproduction and various ovarian activities were studied in Peul ewes bred in traditional management. The litter size was 1,1 ± 0,05 (X-bar ± s.e.m.); it was not affected by season and rank of birth. The intervals between successive parturitions lasted for 325 ± 12 days. This interval was affected by the wet season, but it was not affected by the rank of parturition. There were births all through the year. The maximum frequency of birth was found during the second part of wet season and during post rain period. The minimum frequency of birth was found during the dry season and during the first part of the wet season. The rate of reproduction was 1,25 lambs per ewe per year. The normal ovarian activity was characterized by the luteal phase, which lasted for 13 ± 0,2 days with a highest level of progesterone of 2,5 ± 0,2 ng/ml. The normal follicular phase lasted for 4 ± 0,2 days with progesterone levels varying between 0 and 0,2 ng/ml. During the year, normal ovarian activity was interrupted by short luteal phases (duration = 9 ± 0 days; frequency 10%) during the dry/cold season, and by prolonged follicular phases (duration = 20 ± 4,1 days; frequency = 39%) all through the year. The incidence of these anomalies after kidding was estimated at 25%. The resumption of the ovarian activity occurred between 32 and 191 days after parturition. This parameter was not affected by the season; but it was correlated negatively with the weight of animals during the first month after parturition ($r = -0,77$; $P < 0,05$). These results suggest that the Peul sheep kept on a poor diet preserve good reproductive potentials. The results also suggest that the improvement of diet during post-partum would allow the Peul sheep to increased their reproductive capacities. (author). 16 refs, 3 figs, 2 tabs.

33887 (IAEA-TECDOC–708, pp. 143-147) **Study on the growth rate and puberty in heifers of trypanotolerant N'dama and Baoule breeds in Cote d'Ivoire.** Yesso, P. (IDESSA, Bouake (Cote d'Ivoire). Dept. Elevage); Meyer, C. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. (In French). In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

Growth rates and ovarian activity were monitored in heifers of trypanotolerant N'dama and Baoule breeds (10 N'dama and 20 Baoule) between the ages of 12 and 18 months. The onset of puberty was determined by RIA of progesterone in blood plasma. Only 18 animals (5 N'dama and 13 Baoule) attained puberty during the study. Body weight at onset of puberty was around half of the adult body weight. Relationships between level of nutrition and onset of puberty, daily growth rate and ovarian cyclicity could not be demonstrated. (author). 18 refs, 1 fig., 2 tabs.

33888 (IAEA-TECDOC–708, pp. 151-156) **Validation of the FAO/IAEA RIA kit for the measurement of progesterone in skim milk and blood plasma.** Plaizier, J.C.B. (Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

Validation data for the FAO/IAEA RIA kit for the measurement of progesterone in blood plasma and skim milk obtained by Diagnostic Products Corporation, Los Angeles, USA, and the FAO/IAEA Agricultural Laboratory at Seibersdorf are given. The assay sensitivity as determined by FAO/IAEA was 0.3 nmol/l. Intra-assay and inter-assay variations were lower than 10% and 15% respectively. The accuracy of the assay was satisfactory. The percentage cross-reactivity for the potentially cross-reacting steroids were all acceptably low (i.e. below 2.4%). The assay characteristics for the RIA kit were therefore satisfactory. (author). 2 refs, 7 tabs.

33889 (IAEA-TECDOC–708, pp. 157-170) **Field validation of an EIA kit for progesterone measurement in milk and blood plasma.** Plaizier, J.C.B. (Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the productivity of indigenous African livestock: Results of FAO/IAEA/DGIS co-ordinated research programmes.* 172p. Order Number DE94600178. Source: OSTI; NTIS (US Sales Only); INIS.

An EIA kit for the measurement of progesterone in blood plasma and skim milk was validated and compared with the FAO/IAEA RIA kit at the FAO/IAEA Agricultural Laboratory at Seibersdorf and 9 other laboratories in developed and developing countries. The EIA kit performed well at the FAO/IAEA Laboratory. In the other laboratories high intra-assay variations and poor colour development were observed. The RIA kit performed satisfactory in all participating laboratories. It was concluded that the EIA kit should not be routinely supplied to FAO/IAEA counterpart staff. Some recommendations for further development of the EIA kit were given. (author). 3 refs, 5 tabs.

33890 (IAEA/UNDP–INS/88/013-11) **Agricultural production - Phase 2. Indonesia. Isolation of arboviruses, their identification and the identification of their culicoides vectors in Indonesia: Technical report. Report prepared for the Government of the Republic of Indonesia.** Mellor, P.S. International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 17p. Project INS/88/013;INS/5/021. Order Number DE94600160. Source: OSTI; NTIS (US Sales Only); INIS.

The aims of the two-week mission were to provide assistance in studies to determine the incidence and importance of arbovirus infection in ruminants in Indonesia, specifically to help with identification of the vectors tat transmit bluetongue and related arbovirus infections, and to develop work plans for future studies under the project. The report contains detailed information on handling systems for Culicoides species, on identification of Culicoides to be used for viral isolation and on the isolation of virus from Culicoides.

33891 (IAEA/UNDP–INS/88/013-13) **Agricultural production - Phase 2. Indonesia. Application of molasses-urea blocks to ruminant production in Indonesia: Technical report. Report prepared for the Government of the Republic of Indonesia.** Leng, R.A. (New England Univ., Armidale, NSW (Australia). Dept. of Biochemistry and Nutrition). International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 10p. Project INS/88/013;INS/5/021. Order Number DE94600179. Source: OSTI; NTIS (US Sales Only); INIS.

This report summarizes briefly the accomplishments of a Coordinated Research Program to increase ruminant productivity in Indonesia by the application of urea-molasses blocks. The technology is highly cost effective and readily accepted by farmers. Suggestions are made for a three-year follow-up project to investigate the productivity of ruminants fed with packaged rice straw. 6 photographs.

33892 (IAEA/UNDP–INS/88/013-14) **Agricultural production - Phase 2. Indonesia. Rice - azolla - fish culture - use of nuclear technique: Technical report. Report prepared for the Government of the Republic of Indonesia.** Watanabe, Iwao. International

Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 12p. Project INS/88/013;INS/5/021. Order Number DE94600150. Source: OSTI; NTIS (US Sales Only); INIS.

The primary aim of the expert mission was to provide advice on the use of nuclear techniques to study rice-azolla-fish culture. Results of the work performed so far show that basal application of azolla gives similar or better yields of rice than basal application of urea. Fish productivity was also found to be significantly higher when azolla is present. 2 tabs.

33893 (IAEA/UNDP–INS/88/013-15) **Agricultural production - Phase 2. Indonesia. Methods for increasing ruminant production from available feed resources in Indonesia - nutrition-reproduction interactions: Technical report. Report prepared for the Government of the Republic of Indonesia.** Entwistle, K.W. (James Cook Univ. of North Queensland, Townsville (Australia). Graduate School of Tropical Veterinary Science and Agriculture). International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 10p. Project INS/88/013;INS/5/021. Order Number DE94600180. Source: OSTI; NTIS (US Sales Only); INIS.

This report contains summarized data on the effects of urea-molasses block (UMB) food supplements in dairy and beef cattle, sheep and goats in Java. In addition to improvements in growth and milk production, UMB supplements cause a significant enhancement of ovulation rate and hence fecundity in sheep and goats. Similar data for dairy cattle are not yet available. 5 tabs.

33894 (IAEA/UNDP–THA/85/004-17) **Improving food and agricultural production. Thailand. Biological nitrogen fixation: Technical report. Report prepared for the Government of the Republic of Thailand.** Bowen, G.D. International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 8p. Project THA/85/004;THA/5/031. Order Number DE94600151. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the mission was to assist the counterpart scientists in the analysis and interpretation of data relating to nitrogen fixation studies on grain legumes. The report briefly summarizes the discussions that were held with the counterparts.

33895 (IAEA/UNDP–THA/85/004-18) **Improving food and agricultural production. Thailand. Fertilizer experiments - data analysis and interpretation of results: Technical report. Report prepared for the Government of the Republic of Thailand.** Nelson, L.A. International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 16p. Project THA/85/004;THA/5/031. Order Number DE94600152. Source: OSTI; NTIS (US Sales Only); INIS.

The emphasis of the mission was the provision of training to the staff of the Department of Agriculture, Government of Thailand, in the analysis and interpretation of data from experiments concerning fertilizer applications in agriculture.

33896 (IAEA/UNDP–THA/85/004-19) **Improving food and agricultural production. Thailand. Mutation breeding of food legumes: Technical report. Report prepared for the Government of the Republic of Thailand.** Oram, R.N. International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 15p. Project THA/85/004;THA/5/031. Order Number DE94600153. Source: OSTI; NTIS (US Sales Only); INIS.

The objectives of the present mission were to assist and advise mutation breeders on the induction, selection, utilization and maintenance of useful mutants in grain legumes, especially in soybean, mungbean, red kidney bean, sugar pea, cowpea and yard-long bean, and to provide consultation to plant breeders.

33897 (IAEA/UNDP–THA/85/004-20) **Improving food and agricultural production. Thailand. Improving the reproductive performance of large and small ruminants in Thailand: Technical report. Report prepared for the Government of the Republic of Thailand.** Vercoe, J.E. International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 33p. Project THA/85/004;THA/5/031. Order Number DE94600181. Source: OSTI; NTIS (US Sales Only); INIS.

This document reports the activities of the expert during a three-week mission to Thailand to discuss work aimed at increasing the reproductive efficiency of cattle and buffaloes. In addition the expert assessed the potential for the introduction of hormonal assays to increase productivity in goats. Discussions focussed on the techniques used, the increase in understanding of the reproductive status of the cattle and buffaloes in the region, the impact of the findings on husbandry, breeding and management priorities, the usefulness of the progesterone test and on what additional research is required.

33898 (IAEA/UNDP–THA/85/004-21) **Improving food and agricultural production. Thailand. Application on monoclonal antibodies for progesterone measurement: Technical report. Report prepared for the Government of the Republic of Thailand.** Butcher, G.W. (AFRC Inst. of Animal Physiology and Genetics Research, Cambridge Research Station, Babraham (United Kingdom)). International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 17p. Project THA/85/004;THA/5/031. Order Number DE94600182. Source: OSTI; NTIS (US Sales Only); INIS.

The duties of the mission were to provide instructions on the maintenance of hybridoma cell lines and their culture and the harvesting of monoclonal antibodies; to assist the counterparts in Thailand to develop work plans for the use of monoclonal antibodies in radioimmunoassay measurements of progesterone; and to assess the need for and feasibility of establishing a laboratory for producing monoclonal antibodies directed against progesterone. The report contains a summary of the activities performed in fulfillment of these duties.

33899 (IAEA/UNDP–THA/85/004-22) **Improving food and agricultural production. Thailand. Improving food and agricultural production with nuclear and related technology: Technical report. Report prepared for the Government of the Republic of Thailand.** Vanderdeelen, J. International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1991. 21p. Project THA/85/004;THA/5/031. Order Number DE94600154. Source: OSTI; NTIS (US Sales Only); INIS.

In the northern and north-eastern regions of Thailand, low agricultural production is due mainly to poor soil conditions and variability in the seasonal rainfall distribution. With respect to the former aspect, phosphorus fertilization is one of the major constraints. The aim of the mission was to provide guidance on the studies addressing the use of naturally occurring rock phosphate deposits or phosphate fertilizer. 9 refs, 3 tabs.

33900 (INIS-mf–13679) **Food irradiation newsletter. V. 17, no. 2.** Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1993. 55p. Order Number DE94600171. Source: OSTI; NTIS (US Sales Only); INIS.

This issue of the Food Irradiation Newsletter includes reports of a number of activities of the Food Preservation Section of the FAO/IAEA from the final quarter of 1992 to the middle of 1993. In addition there is a summary of food irradiation activities in the USA, an excerpt from the Official Gazette of the French Republic concerning the use of ionizing radiation to treat camembert made from raw milk, and a discussion of the potential for the application of food irradiation in Russia.

33901 (INIS-mf–13681, pp. 65-69) **Radiobiology. Pt. I.** Nuclear Research Inst., Da Lat (Viet Nam). Jan 1991. In *Report of Activities 1986-1990.* 72p. Order Number DE93633556. Source: OSTI; NTIS (US Sales Only); INIS.

A number of studies on aspects of radiobiology of Vietnamese plants and animals are described including effects of different radiations on crop plants, plant nutrition physiology and plant improvement by radioisotope techniques, and application of nuclear and related techniques on cattle and livestock. (N.H.A). 5 figs.

33902 (INIS-mf–13683) **Radiation decontamination of frozen chicks.** Khan, M.; Akhtar, T.; Sattar, A.; Khan, I. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jul 1992. 2p. Order Number DE94600172. Source: OSTI; NTIS (US Sales Only); INIS.

NIFA annual report 1990-91.

In this report decontamination of frozen chicken has been discussed. The pathogenic bacteria present in poultry meats causes food infectious diseases. The spoilage microorganisms in poultry

meat quickly render the meat unacceptable due to decomposition of the products resulting in off-odour and development of slime. Irradiation (2-5 kGy) and freezing has been found effective in eliminating various pathogens. These combination treatments were tested in local environment. The results indicated that radiation followed by freezing greatly protected quality of poultry meat during storage for 6 months. (A.B.).

33903 (INIS-mf–13684) **Radiosensitivity of red flour beetle tribolium castaneum.** Sattar, A.; Khattak, S.; Hamed, M. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jul 1992. 3p. Order Number DE94600161. Source: OSTI; NTIS (US Sales Only); INIS.

NIFA annual report 1990-91.

In this report radiosensitivity of red beetle has been discussed. Red flour beetle is the most injurious pest causing great losses to stored grain. Radiation is one of the best tools of insect control. Different radiation doses (50 to 200 krads) were employed for different age groups from 1 to 60 days. It is concluded from these results that 200 krad radiation dose caused 100% mortality in red beetle in all age group. (A.B.).

33904 (INIS-mf–13685) **Radiation decontamination of spices.** Akhtar, T.; Sattar, A.; Khan, M.; Khan, I. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jul 1992. 3p. Order Number DE94600162. Source: OSTI; NTIS (US Sales Only); INIS.

NIFA annual report 1990-91.

In this report effect of gamma irradiation and storage of fungal infestation and moisture of red chilies and black pepper has has been discussed. The sample were collected from local market and radiation treatment with 8 kGy of gamma rays completely inhibited fungal infestation in both the spices. It was observed that irradiated samples remained uncontaminated throughout storage period of 12 months. Moisture values increased with advanced storage. The contents were highest in the unpacked control samples and lowest irradiated packed samples. (A.B.).

33905 (INIS-mf–13686) **Chickpea improvement: performance of chickpea mutants in micro yield trials at NIFA.** Hassan, S.; Javed, M.A. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jul 1992. 12p. Order Number DE94600155. Source: OSTI; NTIS (US Sales Only); INIS.

NIFA annual report 1990-91.

Chickpea is an important pulse crop of Pakistan. The premising mutants of varieties C153, C727, C776, K850, ILC195 and ILC482 in advanced generations were tested in four micro yield trials against the check varieties CM-72 and NIFA-88. Several types of mutants of gram crop has been investigated for better yield. Chickpea mutants variety NIFA-88 was approved for general cultivation. (A.B.).

33906 (INIS-mf–13687) **Oilseed brassica improvement through induced mutations.** Shah, S.A.; Ali, I.; Rehman, K. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jul 1992. 15p. Order Number DE94600156. Source: OSTI; NTIS (US Sales Only); INIS.

NIFA annual report 1990-91.

The improvement in processing and refining technologies of oil seed brassica have now made possible the use of rape seed mustard oil as cooking medium shortening, salad ingredients and in margarine in many countries. Different promising rape seed mutants were tested for yield and other agronomic traits in eight preliminary yields trails and results of these trails are presented in this report. Three varieties of rape seeds were subjected to 80, 100, 120 krads and two varieties of mustard were treated 60, 80, 100 krads dose of gamma rays. (A.B.).

33907 (INIS-mf–13688) **Electrophoretic studies on rape seed proteins.** Chaudry, M.A.; Starr, A.; Bibi, N. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jul 1992. 5p. Order Number DE94600157. Source: OSTI; NTIS (US Sales Only); INIS.

NIFA annual report 1990-91.

Electrophoresis is a technique which separates biological molecules on the basis of charge and mass properties. The technique is used for separation, purification, characterization and identification of molecules/compounds. Two major objectives for applications of electrophoresis have been studied in this report i.e. characterization of rape seed proteins and enzymes and identification of rape seed cultivars by polyacrylamide gel electrophoresis (PAGE). Gamma irradiation is being successfully used to create genetic variability and germination which brought about definite changes in the rape seed proteins reflected in different bands. These differences could be used to study variability in crop plants. (A.B.).

33908 (INIS-mf–13689) **Irradiation processing of potatoes, onions and garlic.** Jan, M.; Starr, A.; Wahid, M.; Ahmad, A.; Khan, I. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jul 1992. 4p. Order Number DE94600173. Source: OSTI; NTIS (US Sales Only); INIS.

NIFA annual report 1990-91.

In this report, studies have been conducted on irradiation preservation of potatoes, onions and garlic involving different varieties, harvesting season and storage life. As a result of these investigations, optimum conditions were established for each crop. The effect of irradiation and storage on sprouting, rottage and weight loss of potatoes is presented. The sprouting initiated in the unirradiated samples after 2 months reaching 51, 80 and 100% on 4, 5 and 6 months storage respectively. Weight losses were observed in the irradiated and unirradiated samples. (A.B.).

33909 (AEA-D and R–0508) **Decontamination and free release of reactor pond furniture.** Burke, S.P.; Sanders, M.J. AEA Decommissioning and Radwaste, Winfrith (United Kingdom). 1993. 10p. (CONF-930205–: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE94600191. Source: OSTI; NTIS (US Sales Only); INIS.

As part of the Stage 1 decommissioning project for the Steam Generating Heavy Water Reactor (SGHWR) at AEA Technology's Winfrith site in the UK, the 20 fuel racks in the fuel pond are to be removed. At Winfrith, considerable experience of waste disposal via the free release (below regulatory concern) route has been built up. Using a redundant rack, a trial was carried out to assess the technical and economic feasibility of the decontamination/free release route. An electrochemical process was employed. The trial successfully demonstrated technical feasibility, and an economic assessment concluded that the route can be justified financially. Therefore a decision was taken to dispose of all the racks by decontamination and free release. (Author).

33910 (ANL/CBM/CP–80231) **c-jun gene expression in human cells exposed to either ionizing radiation or hydrogen peroxide.** Collart, F.R.; Horio, M.; Huberman, E. Argonne National Lab., IL (United States). Jun 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930454–3: International seminar on molecular mechanisms in radiation mutagenesis and carcinogenesis, Doorwerth (Netherlands), 19-22 Apr 1993). Order Number DE93017436. Source: OSTI; NTIS; INIS; GPO Dep.

We investigated the role of reactive oxygen intermediates (ROIs) and protein kinase C (PKC) in radiation- and H_2O_2-evoked c-jun gene expression in human HL-205 cells. This induction of c-jun gene expression could be prevented by pretreatment of the cells with Nacetylcysteine (an antioxidant) or H7 (a PKC and PKA inhibitor) but not by HA1004, a PKA inhibitor, suggesting a role for ROIs and PKC in mediating c-jun gene expression. We also investigated potential differences in c-jun gene expression in a panel of normal and tumor cells untreated or treated with ionizing radiation

or H_2O_2. Treatment with radiation or H_2O_2 produced a varied response, from some reduction to an increase of more than an order of magnitude in the steady-state level of c-jun mRNA. These data indicate that although induction of c-jun may be a common response to ionizing radiation and H_2O_2, this response was reduced or absent in some cell types.

33911 (CONF-930607–1) **The Department of Energy's radon testing program.** Scott, H.L. (USDOE, Washington, DC (United States)); Dudney, C.S.; Wilson, D.L.; Gammage, R.B. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1. international workshop on indoor radon remedial action; Rimini (Italy); 27 Jun - 2 jul 1993. Order Number DE93017859. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy recently completed an initial survey of indoor radon in its buildings in response to Public Law 100–551, the Indoor Radon Abatement Act of 1988. Other federal agencies have also conducted radon surveys. This paper presents an overview of the results from radon testing of several thousand buildings ranging from 100 m^2 to over 10,000 M^2 in size. In addition, we have examined results from groups of buildings, classified according to ventilation and usage characteristics. So far, there is no apparent difference among building classes. The paper also discusses our proposal for phased radon surveys. We suggest that first-phase results can be used to identify facilities with radon problems. In the second phase, we suggest measurements be made at a much higher sampling density at facilities with radon problems. The results of the second phase are expected to identify all buildings in need of mitigation.

33912 (CONF-931107–3) **Effect of EMP fields on cell membrane potentials.** Gailey, P.C.; Easterly, C.E. Oak Ridge National Lab., TN (United States). [1993]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Nuclear science symposium; San Francisco, CA (United States); 2-5 Nov 1993. Order Number DE93015819. Source: OSTI; NTIS; GPO Dep.

A simple model is presented for cell membrane potentials induced during exposure to electromagnetic pulse (EMP). Using calculated values of internal electric field strength induced during EMP exposure, the model predicts that cell membrane potentials of about 100 mV may be induced for time frames on the order of 10 ns. Possible biological effects of these potentials including electroporation area discussed.

33913 (DOE/ER/60390–T2) **Electron transport calculations with biomedical and environmental applications.** National Inst. of Standards and Technology, Gaithersburg, MD (United States). [1990]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-86ER60390. Order Number DE93019590. Source: OSTI; NTIS; INIS; GPO Dep.

The general objective is to carry out studies of radiation interactions with matter, and of radiation transport in bulk media, in order to generate basic radiological physics information needed as input for: Biomedical radiation dosimetry, Assessment of radiation hazards in nuclear technology, Modeling of biological radiation action. This work includes the development of transport-theoretic methods, the compilation and critical evaluation of the underlying single-scattering cross sections, and the application of the transport methods to radiological physics problems.

33914 (DOE/ER/61256–T1) **Role of x-ray-induced transcripts in adaptive responses following x-rays: Progress report, Year 2.** Michigan Univ., Ann Arbor, MI (United States). Dept. of Atmospheric and Oceanic Science. [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61256. Order Number DE93040079. Source: OSTI; NTIS; GPO Dep.

I will describe our recent data in which we have extracted and purified a sufficient amount of RNA from primed and unprimed U1-Mel cells to begin the search for new genes which are modulated by priming or high dose irradiation during the establishment and/or challenge of adapted cells, respectively. Gene transcripts which are altered during ASRs now include alterations in xip5 (a gene with homology to human growth hormone), xipl2 (a gene with homology to human angiogenesis factor and a gene which may be involved in apoptosis due to its possible RNase activity), cyclin A (which is altered in primed cells only after a high dose of ionizing radiation), cyclin B (which is also altered in a similar manner as cyclin A), p53 (a tumor suppressor gene involved in cell division control in G_1 following ionizing radiation), and glutathionine S transferase-pi (a gene product which has been demonstrated to be involved in DNA repair and redox cycling). In contrast, the remaining xip CDNA clones [i.e., xip1-4,6-11, which were isolated following high dose ionizing radiation exposure to human U1-Mel cells], Prad-1 (a gene involved in cell cycle controlling events at the G_1 portion of the cell cycle), 36B4 (a gene involved in homeostasis), and cdc2 (a gene involved in the regulation of the S-phase portion of the cell cycle), were not altered following ionizing radiation, either during the establishment or challenge of adapted human cells.

33915 (DOE/FTR–93016213) **Journal of the Citizen Ambassador Program: Nuclear protection delegation to Russia and Ukraine: Foreign trip report, August 3–17, 1992.** Christiansen, H.D. This document provides details of the activities of the Citizen Ambassador Program Nuclear Protection Delegation which convened August 3, 1992 in New York City. Biographical information is provided for the delegation members.

33916 (DOE/FTR–93016757) **Travel to France to coordinate international study of cancer risk among nuclear workers: Foreign trip report, June 17–July 3, 1993.** Fix, J.J. Pacific Northwest Lab., Richland, WA (United States). 8 Jul 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016757. Source: OSTI; NTIS (US Sales Only); GPO Dep.

IARC is coordinating an international collaborative study of cancer risk among nuclear industry workers involving eleven countries. Comparability of recorded dose is an important consideration in the conduct of this study. Because the traveler has been extensively involved in previous combined analyses of data from nuclear worker studies, and because the new study utilizes similar methods to those used in previous study, there was strong interest by IARC for participation of the traveler in this new study to maintain continuity between the studies. The purpose of this trip was to participate in general meetings between the epidemiology and dosimetry subcommittees and to chair working sessions of the dosimetry subcommittee. During a previous meeting of the two subcommittees in December 1991, a protocol for the study was adopted, but detailed procedures remained to be worked out, and were developed during this meeting.

33917 (DOE/FTR–93016758) **Travel to France to participate in epidemiology subcommittee meeting of study on cancer risk among nuclear industry workers: Foreign trip report, June 22–26, 1993.** Gilbert, E.S. Sr. Pacific Northwest Lab., Richland, WA (United States). 28 Jun 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016758. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Purpose of Trip: IARC is coordinating an international collaborative study of cancer risk among nuclear industry workers involving eleven countries. Because the traveler has been extensively involved in previous combined analyses of data from nuclear worker studies. and because the new study utilizes similar methods to those used in previous study, there was strong interest by IARC for participation of the traveler in this new study to maintain continuity between the studies. Thus, the purpose of this trip was to participate in a meeting of the epidemiology subcomittee meeting for the new international collaborative study. The decision to go forth with the study was made at a meeting in June 1988, at which the epidemiology and dosimetry subcommittees were appointed. At a previous meeting of the two subcommittees in December 1991, a protocol for the study was adopted, but detailed procedures remained to be worked out, and were developed at this meeting.

33918 (DOE/FTR–93017245) **Travel to France to confer on technological studies and advances in radioactive particulate monitoring for the work place: Foreign trip report, March 24–April 3, 1993.** Troyer, G.L. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93017245. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The conference was a result of an invitation by French counterparts with interest in direct sharing of information on air sampling, instrument placement, regulatory guidelines of each country, and recent technology developments regarding personnel monitoring as applied to various work place situations. The visit opened with two days of presentations by representatives of both the DOE and CEA showing results of activities in key areas. The CEA identified regulatory documents similar to US orders and federal regulations. These were,comparatively discussed and highlights are described. Each of the US delegates presented summaries of their activities relating to work place radioactive air particulate monitoring. These presentations included sampling efficiency studies, data networking, placement of samplers, methods of suppressing radon interference, and instrument calibration methods. The remainder of the visit involved specific site visits at various research and operational facilities. Radiation protection practices were observed and discussed for each of the situations. Included in the tours were demonstrations of where the instruments are placed, how data are managed and how the instruments are tested and operated.

33919 (DOE/ID–12082(92)) **The Idaho National Engineering Laboratory Site environmental report for calendar year 1992.** Hoff, D.L.; Mitchell, R.G.; Moore, R.; Bingham, L. USDOE Idaho Operations Office, Idaho Falls, ID (United States). Radiological and Environmental Sciences Lab. Jun 1993. 129p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93018935. Source: OSTI; NTIS; GPO Dep.

The results of the various monitoring programs for 1992 indicate that most radioactivity from the INEL operations could not be distinguished from worldwide fallout and natural radioactivity in the region surrounding the INEL Site. Although some radioactive materials were discharged during Site operations, concentrations and doses to the surrounding population were of no health consequence and were far less than State of Idaho and Federal health protection guidelines. The first section of the report summarizes INEL activities related to compliance with environmental regulations and laws for Calendar Year 1992 and January 1 through April 1, 1993. The major portion of the report summarizes results of the RESL environmental surveillance program, which includes the collection of foodstuffs at the INEL boundary and distant offsite locations, and the collection of air and water samples at onsite locations, offsite boundary, and distant locations. The report also compares and evaluates the sample results to appropriate Federal regulations and standards and discusses implications, if any. The USGS ground-water monitoring program is briefly summarized, and data from USGS reports are included in maps showing the spread of contaminants. Effluent monitoring and nonradiological drinking water monitoring performed by INEL contractors are discussed briefly, and data are summarized in tables.

33920 (ETDE-IT–93-201) **Are somatic effects of low neutron doses detectable in vivo?.** Di Majo, V. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Rebessi, S.; Coppola, M.; Saran, A.; Pazzaglia, S.; Covelli, V. 1992. 4p. (CONF-920720–3: International conference on low dose irradiation and biological defense mechanisms, Kyoto (Japan), 12-16 Jul 1992). Order Number DE93522946. Source: OSTI; NTIS (US Sales Only).

In recent years the biological effects of low radiation doses and dose rates has caused growing concern, as proved by the lower dose limits newly recommended for radiological protection. Risk estimates rely substantially on the investigation of in vivo effects at low doses and, in absence of direct human data, as it occurs for high LET radiation, no substitutes to studies of tumor induction and life shortening in the experimental animals can easily be found. However, data from in vivo experimentation in the so-called low-dose region do not appear to be adequate as yet, so that the problem of the shape of the dose-effect relationship at very low doses still remains difficult to solve. This was considered a sound reason to carry out, at our laboratory, a complete observation of life span and late pathology on mice through large scale experiments with graded low doses of neutrons. Useful information on some specific aspects of the biological action of radiation can be derived from in vitro studies, using well characterized model systems, in which test conditionsare more definite and results can be acquired in short time periods.

33921 (ETDE-IT–93-209) **Cytogenetic effects (micronuclei) on human and canine lymphocytes and on Chinese hamster CL1/AF cell line after in vitro irradiation: Comparative analysis.** Catena, C. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Conti, D.; Villani, P.; Archillei, R.; Righi, E. 1992. 22p. (In Italian). Order Number DE93522968. Source: OSTI; NTIS (US Sales Only).

Radiation protection researchers are currently investigating methods to estimate by advanced biological dosimetry techniques the absorbed dose of individuals, especially in the case of accidental exposure, to compare the radiosensitivities of different individuals. This paper reports the results obtained to date by ENEA (Italian Agency for New Technology, Energy and Environment) in its research efforts aimed at the development of a reverse prediction micronuclei analysis method in which doses are estimated by the measurement of induced cytogenetic effects, and the development of a radiosensitivity comparative analysis technique involving the use of human lymphocytes irradiated in vitro in the presence of 3-aminobenzamide (3AB). This (3AB) is an enzyme inhibitor to processes which become particularly active after exposure to ionizing radiations and which is involved in the repair of radioinduced DNA damage. It is hoped that the experimental data obtained through the use of the micronuclei test on canine and human lymphocytes, as well as, on an in vitro irradiated Chinese hamster CL1/AF cell line, in combined irradiation and 3AB inhibitor treatments, will give useful information on the inherent response capability of lymphocytes.

33922 (ETDE-IT–93-210) **Qualification of personal dosimetry services in Italy: Procedures and results.** Cavallini, A. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Klamert, V.; Busuoli, G. 1993. 20p. (CONF-9305175–1: Individual monitoring of ionizing radiation: the impact of recent ICRP and ICRU publications, Villigen (Germany), 5-7 May 1993). Order Number DE93522974. Source: OSTI; NTIS (US Sales Only).

About 80 dosimetry services, processing over 2,000,000 dosemeters yearly, operate in Italy today. As no official guide-lines on the performance of personal dosimetry services have been established in Italy, a Working Group (called ENEA (Italian Agency for Energy, New Technologies and the Environment)-EDP, Personal Dosimetry Experts) has been made up in the framework of ENEA institutional role, to test, on voluntary basis, the reliability of the services. The Group published a paper on the test program: it deals first with each service's methods, facilities, instruments, staff. organization and also with irradiation tests in the 5.2 10^{-6} - 1.3 10^{-3} C/kg exposure range at different X and gamma ray energies. The test program follows the international standards, with due attention to the European Community recommendations. At year's end (1992), 52 services, gathering 56 different types of dosemeters, have been tested in nine sessions. The results of the tests and the evaluation methods of the tested services are discussed.

33923 (ETDE-IT–93-211) **Local recording practice in dose record keeping in Italy.** Litido, M. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Cavallini, A.; Chili, L. 1993. 18p. (CONF-9305175–2: Individual monitoring of ionizing radiation: the impact of recent ICRP and ICRU publications, Villigen (Germany), 5-7 May 1993). Order Number DE93522975. Source: OSTI; NTIS (US Sales Only).

At present, an Italian national dosimetric data bank, maintained by ENEA (National Agency for New Technologies, Energy and Environment), collects information on 50, 000 Italian workers exposed to external ionizing radiation. This paper briefly outlines Italian regulatory aspects about dose record keeping and presents the results of an analysis that compares doses of all the monitored workers in the data bank to those of a small sample of workers whose data are specifically validated by health physicists. The differences in the two dose distributions are analyzed and interpreted

in the light of radiation protection practice and regulatory applications enforced in Italy.

33924 (HW–19296) **P-10 research program in biology.** Thompson, R.C. Hanford Works, Richland, WA (United States). 23 Oct 1950. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017357. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Early this year recommendations for biological research with tritium were outlined by M. E. Getzendaner in document EW-17059. Since then work on many of the preliminary experiments suggested in that document has been and further thought has been given to design a research program to secure the information needed for evaluation of the tritium hazards. It seems desirable at this time to reformulate the projected research more extensively. This document will indicate only the scope of desirable investigations, without attempting to spell out in detail the experimental procedures to be followed. Proposed investigations are studies of water metabolism; studies of hydrogen metabolism; studies with tritium labelled compounds of biological interest; and studies of the biological effect of tritium radiations. The problems outlined under these headings were chosen on the basis of general scientific interest. In most if not all cases, however, the application to radiation hazard evaluation and control is obvious.

33925 (INIS-JP–008, pp. 65-70) **Ionizing radiation, genetic risks and radiation protection.** Sankaranarayanan, K. (Rijksuniversiteit Leiden (Netherlands). Lab. voor Stralengenetica en Chemische Mutagenese). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

With one method of risk estimation, designed as the doubling dose method, the estimates of total genetic risk (i.e., over all generation) for a population continuously exposed at a rate of 0.01 Gy/generation of low LET irradiation are about 120 cases of Mendelian and chromosomal diseases/10^6 live births and about the same number of cases for multifactorial diseases (i.e., a total of 240 cases/10^6). These estimates provide the basis for risk coefficients for genetic effects estimated by ICRP (1991) in its Publication 60. These are: 1.0%/Sv for the general population (which is 40% of 240/10^6/0.01 Gy), and 0.6%/Sv for radiation workers (which is 60% of that for the general population). The results of genetic studies carried out on the Japanese survivors of A-bombs have shown no significant adverse effects attributable to parental radiation exposures. The studies of Gardner and colleagues suggest that the risk of leukaemia in children born to male workers in the nuclear reprocessing facility in Sellafield, U.K., may be increased. However, this finding is at variance with the results from the Japanese studies and at present, does not lend itself to a simple interpretation based on radiobiological principles. In the light of recent advances in the molecular biology of naturally-occurring human Mendelian diseases and what we presently know about multifactorial diseases, arguments are advanced to support the thesis that (i) current risk estimates for Mendelian diseases may be conservative and (ii) an overall doubling dose for all adverse genetic effects may be higher than the 1 Gy currently used (i.e., the relative risks are probably lower). (author).

33926 (INIS-JP–008, pp. 71-76) **The biological basis for dose limitation to the skin.** Fry, R.J.M. (Oak Ridge National Lab., TN (United States). Biology Div.). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Ionizing radiation may cause deterministic effects and cancer. It has been the policy to base dose limits for radiation protection of the skin on the prevention of deterministic effects (1). In the case of cancer in general, dose limitation for radiation protection is based on limiting excess cancer mortality to low levels of radiation. Since skin cancers are seldom lethal, the general radiation protection standards will protect against an increase in excess mortality from skin cancer. However, with the dose limits selected to prevent deterministic effects, there is a significant probability of an excess incidence of skin cancer occurring as a result of exposure during a working lifetime. The induction of skin cancer by radiation is influenced significantly by subsequent exposure to ultraviolet radiation (UVR) from sunlight. This finding raises not only interesting questions about the mechanisms involved, but also about the differences in risk of skin cancer in different populations. The amount and distribution of melanin in the skin determines the degree of the effect of UVR. This paper discusses the mechanisms of the induction of both deterministic and stochastic effects in skin exposed to radiation in relation to radiation protection. (author).

33927 (INIS-JP–008, pp. 77-79) **Studies of skin cancer and thyroid tumors after irradiation of the head and neck.** Shore, R.E. (New York Univ., NY (United States). Medical Center); Moseson, M.; Hildreth, N. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Two longitudinal studies of children given medical X-irradiation to the head and neck are described, one of 2,650 infants who received x-ray treatment for enlarged thymus glands and the other of 2,200 children who received x-ray treatment for tinea capitis (ringworm of the scalp). The thymus study showed a dose-related excess of thyroid cancer and a long period of excess risk. The tinea study also showed an excess of thyroid tumors even though the thyroid dose was only about 0.06 Gy. An excess of non-melanotic skin cancers has also occurred in the tinea study, but no evidence for excess malignant melanomas. The skin cancer excess is not evident among blacks in the study, and, among Caucasians, it is more prominent among those with a light complexion. This suggests that host-susceptibility to ultraviolet effects is an important modifier of skin cancer risk from ionizing irradiation. (author).

33928 (INIS-JP–008, pp. 80-85) **Health risks of atomic bomb survivors: The experiences of those exposed in utero or early in childhood.** Yoshimoto, Y. (Radiation Effects Research Foundation, Hiroshima (Japan)); Soda, M.; Mabuchi, K. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

At the Atomic Bomb Casualty Commission and its successor organization, the Radiation Effects Research Foundation, mortality and morbidity surveys have been continually carried out on about 1,800 persons exposed in utero to the atomic bombings of Hiroshima and Nagasaki. Although the effect of radiation exposure was marked enough to permit observation of a dose-response relationship in the 30 known cases of severe mental retardation among the in utero-exposed, the association between in utero exposure and cancer risk is still uncertain. Based on data for all cancers from 1950 through 1984 for the in utero-exposed, the excess risk per 10,000 person-year-Gy was 6.57 and the relative risk at 1 Gy was 3.77. For the recent years 1985-89, there was no evident excess of cancer risk. During the remaining lifetime, it seems unlikely that any great excess of leukemia will appear. As for the risk of solid tumors, further follow up is in progress. The 1950-89 findings for cancer risk among the in utero-exposed will be compared with cancer risk among A-bomb survivors who were less than 10 years old at the time of the bombings. (author).

33929 (INIS-JP–008, pp. 86-91) **Statistical methods for site-specific analysis of cancer among the A-bomb survivors.** Pierce, D.A. (Oregon State Univ., Corvallis, OR (United States)); Preston, D.L. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Statistical methods are presented for joint, or simultaneous, analysis of the risks of several types of cancer for the A-bomb survivors. Previous analyses have been made either for all cancers except leukemia together, or have been done separately by cancer type. Either of these approaches has serious limitations, and the aim of joint analysis is to overcome these, while taking advantage of the strengths of each. The primary advantage of joint analysis is that models for risks of various cancer types can have some parameters in common, and others which are type-specific. This serves to overcome difficulties due to the limited data on specific cancer types. It also provides for significant tests comparing both type-specific risks and type-specific effects of modifying factors such as sex and age. These methods are exemplified here by joint analysis of three classes of cancer considered by the BEIR-V committee: (i) respiratory, (ii) digestive, and (iii) other cancers, excluding leukemia and breast cancer. The primary aim is to illustrate the general advantages of joint analyses, but in addition some comparison is made between the results of such joint analyses and the conclusions drawn by BEIR-V committee from separate analyses. (author).

33930 (INIS-JP–008, pp. 99-102) **The evaluation of the Chernobyl reactor accident by the help of the Hungarian Surveillance of Germinal Mutations.** Czeizel, A.E. (National Inst. of Hygiene, Budapest (Hungary)); Elek, Cs.; Susanszky, E. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

The germinal mutagenic consequences or radioactive fall-out deposition from the Chernobyl accident in Hungary was evaluated in the ongoing program on the population-based Hungarian Surveillance of Germinal Mutations. The surveillance is based on three groups of indicator conditions: 15 sentinel anomalies (indicators of germinal dominant gene mutations), Down syndrome (an indicator of germinal numerical and structural chromosomal mutations) and unidentified multiple congenital abnormalities (indicators of germinal dominant gene and chromosomal mutations). Cases with indicator conditions were selected from the material of the Hungarian Congenital Abnormality Registry. After the diagnostic accuracies were checked, familial and sporadic cases were separated and only the latter group was evaluated for evidence of new mutations. The analysis did not reveal any measurable germinal mutagenic effects of the Chernobyl reactor accident in Hungary. (author).

33931 (INIS-JP–008, pp. 103-107) **Leukemia incidence in the atomic bomb survivor Life Span Study, 1950 - 87.** Preston, D.L. (Radiation Effects Research Foundation, Hiroshima (Japan)); Mabuchi, K.; Kusumi, S.; Izumi, S. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

The Radiation Effects Research Foundation (RERF) is currently preparing a series of reports on cancer incidence in the Life Span Study (LSS) cohort of atomic bomb survivors for the period from 1950 to 1987. One of these reports will present analyses of the data on the risk of hematopoietic cancers including leukemia, malignant lymphoma, and multiple myeloma. These analyses add an additional 11 years of follow-up to the previous comprehensive analysis of the LSS leukemia data. In this presentation, these data are presented and the methods being used modeling the leukemia risks are outlined. An analysis of the leukemia data pooled over subtypes will be used to illustrate these methods. It is shown that the data suggest a non-linear, concave upward dose response and that the temporal pattern of the radiation-induced excess absolute risks (EARs) depends on age-at-exposure and sex. There is no evidence of city differences in the EAR in this pooled analysis. The results suggest that the EARs for the youngest survivors were initially much higher and have declined more rapidly than those for older survivors. The same general pattern is seen both sexes, but the initial peak incidence is somewhat lower and the rate of decline less rapid for women than for men. (author).

33932 (INIS-JP–008, pp. 108-113) **Effects of dose, dose-rate and fraction on radiation-induced breast and lung cancers: The Canadian fluoroscopy study.** Howe, G.R. (Toront Univ., ON (Canada). Dept. of Preventive Medicine and Biostatistics). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Recent results from a large Canadian epidemiologic cohort study of low-LET radiation and cancer will be described. This is a study of 64,172 tuberculosis patients first treated in Canada between 1930 and 1952, of whom many received substantial doses to breast and lung tissue from repeated chest fluoroscopies. The mortality of the cohort between 1950 and 1987 has been determined by computerized record linkage to the National Mortality Data Base. There is a strong positive association between radiation and breast cancer risk among the females in the cohort, but in contrast very little evidence of any increased risk in lung cancer. The results of this and other studies suggest that the effect of dose-rate and/or fractionation on cancer risk may will differ depending upon the particular cancer being considered. (author).

33933 (INIS-JP–008, pp. 115-122) **Histological types of lung cancer in Japanese A-bomb survivors and Colorado plateau uranium miners.** Land, C.E. (National Cancer Inst., Bethesda, MD (United States)). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

In an investigation of possible differences between lung cancers induced by inhaled radon daughters and external gamma ray and neutrons, a blind pathology panel review was carried out of tissue slides from lung cancer cases diagnosed among 108 Japanese A-bomb survivors and 92 American uranium miners. Slides were selected on the basis of radiation exposure, smoking history, sex, age, and source and quality of pathology material. Consensus diagnoses were obtained with respect to principal subtype, including squamous cell cancer, small cell cancer, adenocarcinoma, and less frequent subtypes. The results were analyzed in terms of population, radiation dose, and smoking history. As expected, the proportion of squamous cell cancer was positively related to smoking history in both populations. The relative frequencies of small cell cancer and adenocarcinoma were very different in the two populations, but this difference was adequately accounted for by differences in radiation dose (more specifically, dose-based relative risk estimates based on published risk coefficients). Data for the two populations conformed to a common pattern, in which radiation-induced cancers appeared more likely to be of the small-cell subtype, and less likely to be adenocarcinomas. No additional explanation in terms of radiation quality (alpha particles vs. gamma rays), uniform or local irradiation, inhaled vs. external radiation source, or other population differences, appeared to be required. (author).

33934 (INIS-JP–008, pp. 129-134) **Un-repairable DNA damage in cell due to irradiation.** Yoshii, Giichi (Kansai Medical Univ., Moriguchi, Osaka (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Radiation-induced cell reproductive deactivation is caused by damage to DNA. In a cell, cellular DNA radical reacts with diffusion controlled rate and generates DNA peroxide radical. The chemical repair of DNA radical with hydrogen donation by thiol competes with the reaction of oxygen with same radicals in the DNA molecules. From the point reaction rates, the prolongation of radical life time is not as great as expected from the reduction in the glutathione content of the cell. This indicates that further reducting compounds (protein bound thiol) are present in the cell. The residual radicals are altered to strand breaks, base damages and so on.

The effective lesions for a number of endpoints is un-repaired double strand break, which has been discovered in a cluster. This event gives risk to high LET radiation or to a track end of X-rays. For X- or electron irradiations the strand breaks are frequently induced by the interactions between sublesions on two strands in DNA. A single strand break followed by radical action may be unstable excited state, because of remaining sugar radical action and of having negative charged phosphates, in which strands breaks will be rejoined in a short time to stable state. On the same time, a break in the double helix will be immediately produced if two breaks are on either or approximately opposite locations. The formation of a double strand break in the helix depends on the ion strength of the cell. The potassium ions are largely released from polyanionic strand during irradiation, which results in the induction of denatured region. Double strand break with the denatured region seems to be un-repairable DNA damage. (author).

33935 (INIS-JP–008, pp. 135-139) **Radiation effects on DNA methylation in mice.** Komura, J. (Tohoku Univ., Sendai (Japan). School of Medicine); Kurishita, A.; Miyamura, Y.; Ono, T.; Tawa, R.; Sakurai, H. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Effects of ionizing radiation on DNA methylation in liver, brain and spleen were examined by high performance liquid chromatography (HPLC). The total methylated cytosine level in the genome was reduced within 8 hours after 3.8 Gy of irradiation in liver of adult mice. But no appreciable effect was observed in brain and spleen. When mice were irradiated at newborn, liver DNA revealed no change in methylated cytosine level. Even though slight effects of radiation were detected in he methylation of the c-myc and c-fos genes, they were only temporary and no long-term effects were observed. These data suggest that the effect of radiation on DNA methylation in vivo is not prevailing a DNA damage, but rather influenced much through biological parameters. (author).

33936 (INIS-JP–008, pp. 140-145) **Molecular nature of X-ray-induced mutations compared with that of spontaneous ones in human c-hprt gene integrated into mammalian chromosomal DNA.** Kimura, Hiroshi (Shiga Univ. of Medical Sciences, Otsu (Japan)); Kato, Takesi. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

X-ray-induced mutations were analysed at molecular levels in comparison with spontaneous mutations. Altered sequences were determined tentatively of 30 independent X-ray-induced mutations in a cDNA of the human hprt gene which was integrated into mammalian chromosome as a part of a shuttle vector. Mutations consisted of base substitutions (37 %), frameshifts (27 %), deletions (27 %) and others (10 %). All these mutational events were distributed randomly over the gene without there being hot spots. The spectrum and distribution of X-ray-induced mutations resembled those of spontaneous mutations. Among base substitutions, transversions were predominant and base substitution mutations occurred more at A:T sites than at G:C sites, which is also the case in spontaneous mutations. Most of the frameshift and deletion mutations induced by X-rays, as well as those spontaneously arising, were characterized by the existence of short direct repeats of several identical bases in a row at the sites of the mutations. A slippage misalignment mechanism in replication well accounts for the generation of these classes of mutations. Judging from the data accumulated so far, it can be concluded that X-ray-induced mutations at molecular levels are similar to those spontaneously occurring. (author).

33937 (INIS-JP–008, pp. 146-150) **BCR-ABL fusion genes are inducible by X-irradiation in vitro.** Ito, Takashi (Radiation Effects Research Foundation, Hiroshima (Japan)); Seyama, Toshio; Mizuno, Terumi; Hayashi, Tomonori; Nakamura, Nori; Akiyama, Mitoshi; Dohi, Kiyohiko. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

The Philadelphia chromosome consists of a reciprocal translocation between the ABL oncogene at chromosome 9q34 and the BCR gene at chromosome 22q resulting in the expression of chimeric BCR-ABL mRNAs specific to chronic myelogenous leukemia (CML). The presence of the fusion genes can be detected with high specificity and sensitivity by means of reverse transcription and polymerase chain reaction. Using this assay, it was possible to detect BCR-ABL fusion genes induced among HL60 cells after 100 Gy of X-irradiation in vitro. A total of five fusion gene transcripts were obtained. These fusion genes contained not only CML-specific BCR-ABL rearrangements, but also other forms of BCR-ABL fusions. These latter genes had junctions of BCR exon 4/ABL exon 2 intervened by a segment of DNA of unknown origin, BCR exon 5/ABL exon 2, and BCR exon 4/ABL exon 2. The results appear to be the first evidence for the induction of the BCR-ABL fusion gene by X-irradiation. In terms of leukemogenesis, it is suggested that only those cells bearing certain CML-related BCR-ABL fusion genes are positively selected by virtue of a growth advantage in vivo. (author).

33938 (INIS-JP–008, pp. 151-154) **Somatic mutation at the TCR loci as a biological dosimeter of radiation-exposed people.** Umeki, Shigeko (Radiation Effects Research Foundation, Hiroshima (Japan)); Kusunoki, Yoichiro; Akiyama, Mitoshi; Endo, Keigo; Ohama, Kozo; Kodama, Takashi; Yamakido, Michio. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

We have recently established a new assay system, the T-cell receptor (TCR) mutation assay, for use as a biological dosimeter of recent radiation exposure. Although there was no obvious dose-dependent increase of the mutant frequency (Mf) at the TCR loci in the lymphocytes from A-bomb survivors, a significant increase of the Mf has been observed in patients who were administered Thorotrast, a radioactive contrast medium, many years ago. These patients have been continuously irradiated with alpha-particles emitted from the deposition of thorium dioxide. Therefore, these results suggested that the TCR mutants had undergone negative selection in vivo in the A-bomb survivors during the 45 years since exposure. To determine whether TCR mutants were actually selected against in vivo, Mfs in 36 uterine cervical cancer patients who had received radiotherapy were investigated, since they have a long survival time after therapy. The TCR Mf among uterine cervical cancer patients decreased exponentially with the passage of time after therapy, and the half-life was calculated to be about 2 years. The Mf in thyroid cancer patients recently treated with ^{131}I increased significantly with increasing ^{131}I dose, taking the half-life of the mutants into consideration. These results suggest that the assay of TCR mutants may be useful as a biological dosimeter for the evaluation of recent radiation exposure. (author).

33939 (INIS-JP–008, pp. 155-159) **Preparation of monoclonal antibodies against radiation-induced protein.** Nozawa, R. (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establishment); Tanaka, A.; Watanabe, H.; Kitayama, S. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

We obtained the 6 monoclonal antibodies against gamma-induced proteins of Deinococcus radiodurans, and these antibodies were designated as Mab-3F, 4B, 4D, 4F, 4G and 12G. Using these antibodies, we investigated the relations between gamma-induced proteins and other stress protein in strain R1, and the induction of proteins were compared among strain R1, resistant mutant (rec1)

and radiosensitive mutant (rec30). We found new 6 proteins recognized by these monoclonal antibodies which were induced after gamma-irradiation especially in strain R1 and rec 1, but not induced in strain rec30. We suppose that these proteins participate in repair of DNA damages including double strand breaks caused by gamma-irradiation. One of them was around 46kDa protein band recognized by Mab-12G, and this protein was so induced in a large quantity after irradiation that the protein could detect by gold staining. In addition to this observation, we found some proteins which were induced in R1 and rec 1 by gamma-irradiation and other stress, but not in strain rec30, such as 31kDa protein band recognized by Mab-3F, 4B and 4G, and other 11 proteins which were especially induced in irradiated strain R1. The latter proteins might be reinforcement factor to radioresistance such as GroE and DnaK, or participant in repair of damage by gamma-irradiation in strain R1. (author).

33940 (INIS-JP–008, pp. 160-165) **Characterization of radiation-induced proteins in Deinococcus radiodurans.** Tanaka, A. (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establishment); Watanabe, H.; Nozawa, R.; Hu, Q.; Kitayama, S. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Induction of proteins after gamma-irradiation in Deinococcus radiodurans were investigated. 10 proteins were induced and about 15 proteins were reduced after irradiation with 6kGy. These proteins were classified to four groups by responses to gamma-rays, UV light, mitomycin C(MMC) treatment and heating. Additional studies were carried out for the characterization of two induced proteins. One protein was induced by gamma-rays, UV light as well as heating. This protein appeared to be a glycoprotein from its reaction with lectin. From the amino acid sequences of N-terminal and internal region, it was found that this protein is homologous to EF-Tu protein of E. coli. Meanwhile the other protein was induced not only by gamma-rays but also by UV light and MMC treatment. This protein seems to be a new enzyme as it has no homology to the known proteins which have ever been analyzed. No accumulations of these two proteins were observed in radiation sensitive strain of D. radiodurans and in both of E. coli and Bacillus pumilus, suggesting that induction of these two proteins would be specific for high resistant strain. (author).

33941 (INIS-JP–008, pp. 166-170) **Comparison of radiation-induced proteins in two revertants with those in a radiation sensitive mutant of Deinococcus radiodurans.** Hu Qian (Suzhou Medical Coll., JS (China)); Tanaka, Atsushi; Kobayashi, Yasuhiko; Nozawa, Ranko; Watanabe, Hiroshi. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

In order to search proteins responsible for DNA repair, the intracellular proteins in gamma-irradiated cells of D.radiodurans R1 and its three mutants were analyzed by means of two-dimensional gel electrophoresis. Two new proteins, P35 (M.W. 35 kDa) and P92 (M.W. 92 kDa), were found in the cells of the radioresistant revertant (KH8401-1-5) and D.radiodurans R1. However, only P92 was detected in the moderately radioresistant revertant (KH8401-10-7). Both proteins were not detected in the cells of the radiosensitive mutant (KH8401). On the other hand, one protein, P25 (M.W. 25 kDa), which was detected either before or after gamma-irradiation, was only found in KH8401-10-7. These results suggest that these special induced proteins, P35 and P92, might be directly responsible for radiation resistance. The analyses of similar proteins in the cells of E.coli B/r and Deinobactor grandis KS0460 were also carried out. (author).

33942 (INIS-JP–008, pp. 171-176) **High resistance of fibroblasts from Mongolian gerbil embryos to cell killing and chromosome aberrations by X-irradiation.** Suzuki, F. (Kanazawa Univ. (Japan). Faculty of Pharmaceutical Sciences); Nakao, N.; Nikaido, O.; Kondo, S. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Mongolian gerbil (Meriones unguiculatus) is known to be one of the most radioresistant animal species. In order to determine whether there is any correlation between mortality of mammals exposed to γ- or X-rays and radiation sensitivity of culture cells derived from different mammalian species, we have examined the X-ray survival curves of normal diploid fibroblasts from Mongolian gerbil embryos and compared with those of other cultured embryo cells from various laboratory animals and normal human. There was a big difference in cell survival to X-rays among different mammalian species. The D_0 values of Mongolian gerbil cells ranged from 2.3 to 2.6 Gy which are twice as high as those of human cells. The mean D_0 value of human cells was 1.1 Gy. Mouse, rat, Chinese hamster and Syrian/golden hamster cells showed similar D_0 values ranging from 1.7 to 2.0 Gy. When cells were irradiated with 2 Gy of X-rays, three times longer mitotic delay was observed in human cells than in Mongolian gerbil cells. At this X-ray dose, furthermore, ten times more chromosome aberrations were detected in human cells than in Mongolian gerbil cells, and the frequencies of other rodent cells lay between the values for the two cell strains. These data indicate that the Mongolian gerbil cells are resistant to X-ray-induced cell killing and chromosome aberrations, and that radiation sensitivity of primarily cultured mammalian cells may be reflected by their radioresistance in vivo. (author).

33943 (INIS-JP–008, pp. 177-180) **Alleviation of acute radiation damages by post-irradiation treatments.** Kurishita, A. (Tohoku Univ., Sendai (Japan). School of Medicine); Ono, T. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Radiation induced hematopoietic and gastro-intestinal damages in mice were tried to alleviate experimentally by post-treatment. Combined treatment of OK-432 and aztreonam clearly prevented the radiation induced sepsis and elevated the survival rate in mice; the survival was 80% in the OK-432 plus aztreonam group while it was 55% in the group treated with OK-432 alone and 0% with saline. Irsogladine maleate, an anti-ulcer drug, increased the survival rate of jejunal crypt stem cells with a clear dose-related trend. The D_0 for irsogladine maleate was 2.8 Gy although it was 2.3 Gy for saline, These findings suggest that some conventional drugs are effective for radiation induced hematopoietic and gastro-intestinal damages and the possibility that they can be applied for people exposed to radiation accidentally. (author).

33944 (INIS-JP–008, pp. 181-186) **Effects of 5-fluorouracil on survival and hematopoiesis in irradiated mice.** Kojima, E. (National Inst. of Radiological Sciences, Chiba (Japan)); Tsuboi, A. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

The effects of whole-body irradiation on survival and hematopoiesis were studied in mice treated with 5-fluorouracil (5-FU). Animals (ddy-SLC male mice, 8 - 10 weeks old) were injected with 5-FU (i.p.) as a single dose (150 mg/kg) at various times before or after irradiation with X-rays. In mice pretreated with 5-FU at different intervals before X-irradiation (1.9 Gy), the radiosensitivity of the CFU-S population changed day by day after the treatment. The maximal survival for femoral CFU-S was obtained in mice treated with 5-FU at 5 days before irradiation. The post-irradiation recovery for femoral and splenetic CFU-S in mice pretreated with 5-FU at 3 days before X-irradiation (1.9 Gy) was faster than in mice given irradiation alone. The pattern of change for thrombocyte counts in the circulating blood after X-irradiation (1.9 Gy) was greatly modified by the pretreatment with 5-FU at 5 days before

irradiation, being effective in lessening the radiation-induced depression. For survival experiments, treatment of mice with 5-FU at 5 days before X-irradiation with graded doses (4.8 to 7.6 Gy) was the most effective in reducing for radiation lethality. The dose reduction factor was obtained as 1.24. However, treatment with 5-FU at 1 day and 2 hours before, and at times after irradiation increased the radiation lethality compared to the untreated controls. Such phenomena on the decrease or the increase of radiation lethality of 5-FU exhibited a similar pattern to the radiation-dose relation on endogenous and exogenous CFU-S. (author).

33945 (INIS-JP–008, pp. 187-191) **Genetic control of the radiosensitivity of lymphoid cells for antibody-forming ability in CXS series of recombinant inbred mouse strains.** Okumoto, M. (Osaka Prefectural Univ., Sakai (Japan). Research Inst. for Advanced Science and Technology); Mori, N.; Nishikawa, R.; Imai, S.; Hilgers, J.; Takamori, Y.; Yagasaki, O. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 558p. (CONF-9203223–: International conference on radiation effects and protection, Mito (Japan), 18-20 Mar 1992). In *Proceedings of the international conference on radiation effects and protection.* Order Number DE93764166. Source: OSTI; NTIS; INIS.

Incidence of radiation-induced lymphomas differs remarkably among various mouse strains. BALB/cHeA (C) mice are highly susceptible to radiation induction of lymphomas, while STS/A (S) mice are resistant. Thus, the induction of the disease is controlled by some genetic factors. To examine an involvement of radiosensitivity of lymphoid cells in lymphomagenesis, we have compared genetic control of the radiosensitivity for antibody-forming ability with that of lymphoma development in BALB/cHeA, STS/A, $(CXS)F_1$ hybrids and CXS series of recombinant inbred strains. Decrease of number of splenic plaque-forming cell (PFC) in Jerne's method by 3 Gy of X-irradiation for BALB/cHeA mice was larger than that for STS/A mice by more than one order of magnitude. $(CXS)F_1$ hybrid mice showed small number of decrease of PFC similar to STS/A mice suggesting that phenotype of radioresistance was dominant over sensitivity. The best concordance between genetic markers and radiosensitivities of antibody-forming ability in recombinant inbred strains was observed in a region containing Igh locus on chromosome 12. The results show that one locus controlling the radioresistance of lymphoid cells for antibody-forming ability might exist in the region containing Igh locus, and that this region clearly differ from a region with Ifa locus on chromosome 4 which regulate the susceptibility to radiation-induced lymphomagenesis. (author).

33948 (ORNL/FTR–4345) **Travel to Great Britain and Germany concerning radiation dosimetry research: Foreign trip report, July 7–August 10, 1992.** Turner, J.E. Oak Ridge National Lab., TN (United States). 24 Aug 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014401. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A study is being coordinated by D. T. Goodhead and H. Nikjoo of the Medical Research Council (MRC) to analyze and compare the characteristics of electron tracks in water as computed independently at four different laboratories. The traveler and his colleagues at Oak Ridge National Laboratory (ORNL) are one of the participating parties. The traveler discussed this work, which until now has been carried out remotely by means of Bitnet, in detail at MRC. Dr. Nikjoo will present results in September at the Eleventh Symposium on Microdosimetry, which ORNL is hosting. At GSF, the traveler continued collaborative work with H. G. Paretzke on general concepts in radiation dosimetry. The research focused on combining track-structure calculations with characterizations of microscopic biological targets.

33949 (ORNL/FTR–4642) **Travel to Austria to attend meeting on effects of atomic radiation: Foreign trip report, May 22–29, 1993.** Selby, P.B. Oak Ridge National Lab., TN (United States). 9 Jun 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93015789. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the forty-second session of UNSCEAR where he took part in the meetings of the Biological Subgroup and the Working Group of the entire UNSCEAR Committee. The traveler made important contributions to the "Report to the General Assembly" and to the long annexes entitled, "Hereditary Effects of Radiation" and "Influence of Dose and Dose Rate on Stochastic Effects of Radiation." All three of these documents received final approval for publication late this year. The traveler has played a major role in the development of the annex on hereditary effects of radiation, and he wrote the 7-page Rapporteur's report recording the most important final changes agreed to for that annex. The new report includes preliminary results from the traveler's large radiation experiments using the Assessment of Dominant Damage approach, and it should set the stage nicely for a major improvement in the direct method of genetic risk estimation when those experiments are complete. The traveler's familiarity with many earlier experiments done at ORNL by himself and others proved to be of importance to the Subgroup during its dicussions.

33950 (ORNL/TM–12224) **Technical basis for nuclear accident dosimetry at the Oak Ridge National Laboratory.** Kerr, G.D.; Mei, G.T. Oak Ridge National Lab., TN (United States). Aug 1993. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93040067. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) Environmental, Safety, and Health Emergency Response Organization has the responsibility of providing analyses of personnel exposures to neutrons and gamma rays from a nuclear accident. This report presents the technical and philosophical basis for the dose assessment aspects of the nuclear accident dosimetry (NAD) system at ORNL. The issues addressed are regulatory guidelines, ORNL NAD system components and performance, and the interpretation of dosimetric information that would be gathered following a nuclear accident.

33951 (ORNL/TM–12365) **Evaluation of discrepancies between thermoluminescent dosimeter and direct-reading dosimeter results.** Shaw, K.R. Oak Ridge National Lab., TN (United States). Jul 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93017986. Source: OSTI; NTIS; INIS; GPO Dep.

Currently at Oak Ridge National Laboratory (ORNL), the responses of thermoluminescent dosimeters (TLDs) and direct-reading dosimeters (DRDs) are not officially compared or the discrepancies investigated. However, both may soon be required due to the new US Department of Energy (DOE) Radiological Control Manual. In the past, unofficial comparisons of the two dosimeters have led to discrepancies of up to 200%. This work was conducted to determine the reasons behind such discrepancies. For tests conducted with the TLDs, the reported dose was most often lower than the delivered dose, while DRDs most often responded higher than the delivered dose. Trends were identified in personnel DRD readings, and ft was concluded that more training and more control of the DRDs could improve their response. TLD responses have already begun to be improved; a new background subtraction method was implemented in April 1993, and a new dose algorithm is being considered. It was concluded that the DOE Radiological Control Manual requirements are reasonable for identifying discrepancies between dosimeter types, and more stringent administrative limits might even be considered.

Most of the energy absorbed in the cell nucleus from a radiation field goes into the aqueous medium that surrounds macromolecules, like DNA, which are critical to the normal function of cells. This part of the energy deposition produces numerous reactive species that can diffuse to DNA sequences and induce chemical changes. The average diffusion distance of the free radicals that mediate this indirect mode of DNA damage is only a few nanometers because the cellular medium contains a high concentration of molecules that rapidly scavenge the radiation-induced species. Under these conditions, direct interaction of the radiation field with DNA can not be neglected as a potential mode of damage induction. Two aspects of the direct effect are discussed in this paper: (1) screening of the interaction between DNA and charged particles by the dielectric response of the aqueous medium and (2) the impact-parameter dependence of these interactions.

33954 (PNWD–2161-HEDR) **Fuel-element failures in Hanford single-pass reactors 1944–1971.** Gydesen, S.P. Pacific Northwest Lab., Richland, WA (United States). Jul 1993. 357p. Sponsored by Department of Health and Human Services, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017969. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford Environmental Dose Reconstruction Project.

The primary objective of the Hanford Environmental Dose Reconstruction (HEDR) Project is to estimate the radiation dose that individuals could have received as a result of emissions since 1944 from the US Department of Energy's (DOE) Hanford Site near Richland, Washington. To estimate the doses, the staff of the Source Terms Task use operating information from historical documents to approximate the radioactive emissions. One source of radioactive emissions to the Columbia River came from leaks in the aluminum cladding of the uranium metal fuel elements in single-pass reactors. The purpose of this letter report is to provide photocopies of the documents that recorded these failures. The data from these documents will be used by the Source Terms Task to determine the contribution of single-pass reactor fuel-element failures to the radioactivity of the reactor effluent from 1944 through 1971. Each referenced fuel-element failure occurring in the Hanford single-pass reactors is addressed. The first recorded failure was in 1948, the last in 1970. No records of fuel-element failures were found in documents prior to 1948. Data on the approximately 2000 failures which occurred during the 28 years (1944–1971) of Hanford single-pass reactor operations are provided in this report.

33955 (RISO-HOT-DECOM-P–5) **Decommissioning of the Risoe Hot Cell facility: 5. Periodic report covering July 1 to December 31, 1992.** Carlsen, H. Risoe National Lab., Roskilde (Denmark). Materials Dept. Feb 1993. 7p. Contract FI2D-0011-DK. Order Number DE94600192. Source: OSTI; NTIS; INIS.

A concise description of the current status (December 31st, 1992) regarding the decommissioning of the hot cell facility at Risoe National Laboratory is given in this periodic report. During the second half of the year 1992, all remaining fissile material and a large amount of contaminated material were removed, major repair work was carried out on the in-cell crane, the shielded storage facility was decontaminated and sealed, iodine filters in the cell ventilation system were removed, remote cleaning was carried out on three concrete cells to radiation levels acceptable for final cleaning by frogmen, and the remaining work schedule was planned. These processes are briefly described. Some breakdowns of older, but vital equipment (i.e. the in-cell crane and the power manipulator) that was taken into extensive use led to a certain amount of delay. The collective radiation doses during this half-year were no higher than under normal operation of the facility, and amounted to 12 man-mSv ascribed to 14 persons. It was concluded that, when removing old epoxy paint in the cells using paint strippers applied by hand, personnel can wear polythene oversuits, although a technique for remote handling has been developed. Tables illustrate measured radiation levels in cells number 1,4,5 and 6, and a diagram describes the shielded storage facility. (AB).

33956 (SAND–93-0761C) **Dissolution rate and radiation dosimetry of metal tritides.** Jow, Hong-Nian (Sandia National Labs., Albuquerque, NM (United States)); Cheng, Yung-Sung. Sandia National Labs., Albuquerque, NM (United States); Inhalation Toxicology Research Inst., Albuquerque, NM (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789 ;AC04-76EV01013. (CONF-9303187–1: DOE radiation protection workshop; Asia and Pacific Basin Regional Congress on radiation protection, Las Vegas, NV (United States); Beijing (China), Mar 1993; 18-22 oct 1993; CONF-9310101–1). Order Number DE93015023. Source: OSTI; NTIS; INIS; GPO Dep.

Metal tritides including titanium tritide (Ti^3H_x) and erbium tritide (Er^3H_x) have been used as components of neutron generators. These compounds can be released to the air as aerosols during fabrication, assembling and testing of components or in accidental or fugitive releases. As a result, workers could be exposed to these compounds by inhalation. A joint research project between SNL and ITRI (Inhalation Toxicology Research Institute) was initiated last fall to investigate the solubility of metal tritides, retention and translocation of inhaled particles and internal dosimetry of metal tritides. The current understanding of metal tritides and their radiation dosimetry for internal exposure are very limited. There is no provision in the ICRP-30 for tritium dosimetry in metal tritide form. However, a few papers in the literature suggested that the solubility of metal tritide could be low. The current radiation protection guidelines for metal tritide particles are based on the assumption that the biological behavior is similar to tritiated water which behaves like body fluid with a relative short biological half life (10 days). If the solubility of metal tritide is low, the biological half life of metal tritide particles and the dosimetry of inhalation exposure to these particles could be quite different from tritiated water. This would have major implications in current radiation protection guidelines for metal tritides Including annual limits of intakes and derived air concentrations. The preliminary results of metal tritide dissolution study at ITRI indicate that the solubility of titanium tritide is low. The outlines of the project, the preliminary results and future work will be discussed in presentation.

33957 (SIS–1993:2) **Individual measurements of external radiation doses from Chernobyl fallout in Oeystre Slidre.** Woehni, T.; Selnaes, T.; Strand, P. Statens Straalevern, Oesteraas (Norway). 1993. 22p. (In Norwegian). Order Number DE94600194. Source: OSTI; NTIS; INIS.

External doses from Chernobyl fallout have in previous reports primarily been estimated on the basis of theoretical calculations based on measurements of ground activity. The uncertainty in these estimations are large, partly due to limited data regarding the fallout pattern, and partly because the conversion factors from total ground activity to effective doses depend on the activity depth-distribution in soil. In the present project, measurements of external doses have been performed with the aid of individual dosemeters. Oeystre Slidre was the single municipality receiving the highest fall-out levels after the Chernobyl accident, and thus the area best suited for detecting the increase in external radiation levels by this method. The measurements show that the increase in external radiation levels after the Chernobyl accident is clearly detectable, at least in areas with the highest activity levels. However, even in this areas natural background radiation constitute the largest component to the total dose from external radiation, namely 60 to 70%. 20 refs., 3 figs., 4 tabs.

33958 (SIS–1993:3) **Calibration of the Norwegian standards for measuring ionizing radiation in radiotherapy.** Bjerke, H.; Unheim, J.F. Statens Straalevern, Oesteraas (Norway). 1993. 21p. (In Norwegian). Order Number DE94600195. Source: OSTI; NTIS; INIS.

As part of calibration on a regulary basis, the Norwegian secondary standards on ionizing radiation were calibrated at the Bureau International des Poids et Mesures (BIPM) in Paris in 1991. The secondary standards set up the basis for the calibration service at the Norwegian Radiation Protection Authority. The X-ray range from 10 to 50 kV and 100 to 250 kV is covered, as well as γ-radiation from ^{60}Co (1.25 MeV). A new ionization chamber was calibrated in the ^{60}Co radiation beam in addition to calibration of existing secondary standards. Furthermore, two of the ionization chambers were also calibrated in water in the ^{60}Co radiation beam. This makes it possible to offer the radiotherapy centers in Norway a calibration factor based on calibration in water. 8 refs., 7 figs., 7 tabs.

33959 (WHC-SA–1826) **1991 implementation of As Low As Reasonably Achievable (ALARA) administrative radiation exposure levels: Experiences and lessons learned.** Aldridge, T.L.; Baumann, B.L. Westinghouse Hanford Co., Richland, WA (United States). Jun 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930746–1: Annual meeting of the Health Physics Society, Atlanta, GA (United States), 11-15 Jul 1993). Order Number DE93019120. Source: OSTI; NTIS; INIS; GPO Dep.

As Low As Reasonably Achievable (ALARA) radiation exposure levels were implemented on January 1, 1991, by Westinghouse Hanford Company (WHC), a prime US Department of Energy (DOE) contractor, located in Richland, Washington. This paper describes the radiation exposure levels which were implemented and the associated experiences and lessons learned. The issue of a report from the Committee on Biological Effectiveness of Ionizing Radiation in 1989 prompted DOE to re-evaluate its position on radiation exposure limits and the resulting doses received by occupational radiation workers. DOE requested that all it's contractors determine the impacts to operations from reduced radiation exposure levels.

33960 (ANL/ESH/CP–80561) **Industrial hygiene of selected heavy metals.** Woodring, J.L. Argonne National Lab., IL (United States). [1993]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930802–12: 206. American Chemical Society national meeting, Chicago, IL (United States), 22-27 Aug 1993). Order Number DE93019558. Source: OSTI; NTIS; INIS; GPO Dep.

The industrial hygiene of heavy metals consists of recognition, evaluation, and control of exposures in the occupational environment. Several of these metals have been in use since ancient times. Reports of health effects and poisonings from overexposures also have a long history. This report discusses the industrial hygiene of the heavy metals, lead, cadmium, mercury, and manganese.

33961 (DOE/ER/61029–14) **The hygroscopicity of indoor aerosol particles.** Wei, L. Clarkson Univ., Potsdam, NY (United States). Dept. of Chemistry. Jul 1993. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61029. Order Number DE93040689. Source: OSTI; NTIS; INIS; GPO Dep.

A system to study the hygroscopic growth of particle was developed by combining a Tandem Differential Mobility Analyzer (TDMA) with a wetted wall reactor. This system is capable of mimicking the conditions in human respiratory tract, and measuring the particle size change due to the hygroscopic growth. The performance of the system was tested with three kinds of particles of known composition, NaCl, $(NH_4)_2SO_4$, and $(NH_4)HS0_4$ particles. The hygroscopicity of a variety of common indoor aerosol particles was studied including combustion aerosols (cigarette smoking, cooking, incenses and candles) and consumer spray products such as glass cleaner, general purpose cleaner, hair spray, furniture polish spray, disinfectant, and insect killer. Experiments indicate that most of the indoor aerosols show some hygroscopic growth and only a few materials do not. The magnitude of hygroscopic growth ranges from 20% to 300% depending on the particle size and fraction of water soluble components.

33962 (LA–12539-MS) **Kinetics programs for simulation of tropospheric photochemistry on the global scale.** Elliott, S. (Los Alamos National Lab., NM (US)); Kao, C.Y.J.; Turco, R.P.; Zhao, X.P. Los Alamos National Lab., NM (United States). Aug 1993. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93019035. Source: OSTI; NTIS; INIS; GPO Dep.

The study of tropospheric kinetics underlies global change because key greenhouse gases are photochemically active. Modeling of tropospheric chemistry on a global scale is essential because some indirect greenhouse gases are short-lived and interact in a non-linear fashion. It is also extremely challenging, however; the global change grid is extensive in both the physical and temporal domains, and critical lower atmospheric species include the organics and their oxidized derivatives, which are numerous. Several types of optimization may be incorporated into kinetics modules to enhance their ability to simulate the complete lower atmospheric gas phase chemical system. (1) The photochemical integrator can be accelerated by avoiding matrix and iterative solutions and by establishing families. Accuracy and mass conservation are sacrificed in the absence of iteration, but atom balancing is restorable post hoc. (2) Chemistry can be arranged upon the massive grid to exploit parallel processing, and solutions to its continuity equations can be automated to permit experimentation with species and reaction lists or family definitions. Costs in programming effort will be incurred in these cases. (3) Complex hydrocarbon decay sequences can be streamlined either through structural lumping methods descended from smog investigations, which require considerable calibration, or by defining surrogates for classes of compounds, with a loss in constituent detail. From among the available options, the most advantageous permutations will vary with the specific nature of any eventual global scale study, and there is likely to be demand for many approaches. Tracer transport codes serve as a foundation upon which tropospheric chemistry packages will be tested. Encroachment of the NO_x sphere of influence upon tropical rain forests and the upper free troposphere are two examples of specific problems to which full three-dimensional chemical simulations might be applied.

33963 (LA–12615-MS) **Acute and chronic sulfur dioxide fumigation of Piñon pine seeds and seedlings: Data compilation.** Trujillo, M.L. (Los Alamos National Lab., NM (United States)); Ferenbaugh, R.W.; Gladney, E.S.; Bowker, R.G. Los Alamos National Lab., NM (United States). Sep 1993. 34p. Sponsored by

Department of the Interior, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93019359. Source: OSTI; NTIS; GPO Dep.

Piñon pine germinating seeds, emergent seedlings, and one-year-old seedlings were exposed to sulfur dioxide under both acute and chronic exposure conditions. These fumigations were conducted in order to determine the potential for damage to piñon pine in southwestern national parks and monuments where there is potential for exposure to elevated sulfur dioxide concentrations from smelters and power plants. Injury was apparent only in acute fumigations of one-year-old seedlings at ambient sulfur dioxide concentrations of greater than 3 ppm. Chronic fumigations were conducted only a ambient concentrations of 0.2 ppm. Piñon pine resistance was evidenced by lack of effect of fumigation on biomass and growth parameters. Growth rate data for both experimental and control seedlings were fit to a linear growth model with a correlation (r^2 = 0.95). The results of this study agree with other data in the literature and indicate that damage from elevated sulfur dioxide concentrations in southwestern national parks and monuments is much more likely for other, more sensitive, species than for piñon pine.

33964 (ORNL/FTR–4627) **Travel to ORNL for meeting on Protection Against Environmental Mutagens and Carcinogens (ICPEMC): Foreign trip report, May 9–23, 1993.** Favor, J.B. (Institut fuer Saugetiergenetik, GSF-Forschungszentrum fuer Umwelt und Gesundheit, D-8042 Neuherberg, (Germany)). Oak Ridge National Lab., TN (United States). 26 May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93015638. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the fourth meeting of a special work group of the International Commission for the Protection Against Environmental Mutagens and Carcinogens (ICPEMC) held May 10–12, 1993, at the Oak Ridge National Laboratory. This special ICPEMC work group was convened in cooperation with ICPEMC and the Biomedical and Environmental Information Analysis Section of the Health and Safety Research Division by request of The US Environmental Protection Agency (EPA). The work group is charged with the preparation of a document for on extrapolation methods for genetic toxicology risk assessment. The draft of this document, prepared during previous meetings, was reviewed for eventual submission to EPA in June 1993.

5604 Other Environmental Pollutant Effects

33965 (ETDE-IT–93-208) **Biological effects from electromagnetic fields: Research progress and exposure measurements.** Mauro, F. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Lovisolo, G.A.; Raganella, L. 1992. 6p. (In Italian). Order Number DE93522967. Source: OSTI; NTIS (US Sales Only); INIS.

Although it is commonly accepted that exposure to high levels of electromagnetic, micro- and radiofrequency waves produces harmful effects to the health of man, the formulation of exposure limits is still an open process and dependent upon the evolving level of knowledge in this field. This paper surveys the current level of knowledge gained through 'in vitro' and 'in vivo' radiological and epidemiological studies on different types of electromagnetic radiation derived effects - chromosomal, mutagenic, carcinogenic. It then reviews efforts by international organizations, e. g., the International Radiation Protection Association, to establish exposure limits for radiofrequency electromagnetic fields. Brief notes are given on the electromagnetic radiation monitoring campaign being performed by public health authorities in the Lazio Region of Italy.

33966 (UCRL-JC–112318) **The use of dimorphic Alu insertions in human DNA fingerprinting.** Novick, G.E. (Florida International Univ., Miami, FL (United States). Dept. of Biological Sciences); Gonzalez, T.; Garrison, J.; Novick, C.C.; Herrera, R.J.; Batzer, M.A.; Deininger, P.L. Lawrence Livermore National Lab., CA (United States). 4 Dec 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211249–1: 2. international symposium on DNA fingerprinting, Belo Horizonte (Brazil), 9 Nov 1992). Order Number DE93016530. Source: OSTI; NTIS; GPO Dep.

We have characterized certain Human Specific Alu Insertions as either dimorphic (TPA25, PV92, APO), sightly dimorphic (C2N4 and C4N4) or monomorphic (C3N1, C4N6, C4N2, C4N5, C4N8), based on studies of Caucasian, Asian, American Black and African Black populations. Our approach is based upon: (1) PCR amplification using primers directed to the sequences that flank the site of insertion of the different Alu elements studied; (2) gel electrophoresis and scoring according to the presence or absence of an Alu insertion in one or both homologous chromosomes; (3) allelic frequencies calculated and compared according to Hardy-Weinberg equilibrium. Our DNA fingerprinting procedure using PCR amplification of dimorphic Human Specific Alu insertions, is stable enough to be used not only as a tool for genetic mapping but also to characterize populations, study migrational patterns and track the inheritance of human genetic disorders.

57 HEALTH AND SAFETY

33969 (ANL/ESD/TM–49) **Videographic GIS database documentation project for Ft. Knox, Kentucky: Planning and process.** Sullivan, R.G.; Vogt, M.C. Argonne National Lab., IL (United States). Jun 1992. 32p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93019055. Source: OSTI; NTIS; GPO Dep.

The Geographic Resource Analysis Support System (GRASS), a geographic information system (GIS), has been fielded at approximately 50 US Army training installations as a land-management

decision-making tool. Use of the GRASS GIS requires the compilation of numerous digital maps of environmental parameters, including elevation, soils, and hydrography. One of the uses of the GRASS GIS is to create digital graphic images that portray geographic data. A recently emerging technology called computer videographics can be used to graphically enhance GRASS-generated images, thereby creating new ways to visualize GRASS analysis results. Furthermore, videographic tools can be used to convert GRASS images into standard graphic file formats that can be displayed on low-cost personal computers, using inexpensive application software to view the images. The pilot project described in this report demonstrated the capability of videographic tools to enhance GRASS imagery through improved graphic visualization (including three-dimensional visualization) and enhanced labeling. The project also developed self-running demonstrations of GRASS imagery from Ft. Knox, Kentucky, on DOS- and Macintosh-compatible diskettes, using low-cost slide-show software to display the images.

33970 (BNL–49194) **Overview of physical oceanographic measurements taken during the Mt. Mitchell Cruise to the ROPME Sea Area.** Reynolds, R.M. Brookhaven National Lab., Upton, NY (United States). 31 Mar 1993. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-9301123–1: 1. scientific workshop on results of the R/V Mt. Mitchell cruise, Kuwait City (Kuwait), 24-28 Jan 1993). Order Number DE93018460. Source: OSTI; NTIS; INIS; GPO Dep.

The ROPME Sea Area (RSA) is one of the most important commercial waterways in the world. However, the number of direct oceanographic observations is small. An international program to study the effect of the Iraqi oil spill on the environment was sponsored by the ROPME, the Intergovernmental Oceanographic Commission, and the National Oceanic and Atmospheric Administration (NOAA).

33971 (DOE/ER/14153–3) **Reactive fluid flow models and applications to diagenesis, mineral deposits and crustal rocks.** Lasaga, A.C.; Rye, D.M. Yale Univ., New Haven, CT (United States). [1993]. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER14153. Order Number DE93019587. Source: OSTI; NTIS; GPO Dep.

Funds are requested for a combined theoretical and field study of coupled fluid flow, heat and mass transport, and chemical reaction in hydrothermal and metamorphic systems. An existing computer code developed by the applicants which numerically treats multi-component, finite-rate reactions combined with advective and dispersive transport in one and two dimensions and which incorporates isotopic exchange and heat and mass transfer will continue to be developed and applied in a variety of geological settings. The code we have developed simultaneously solves for mass transport and reaction, thus offering a significant improvement in computational efficiency over existing "batch" reaction path codes. By coupling flow and chemical reaction in a hydrothermal system, we can explicitly investigate the extent to which characteristic flow-reaction paths govern the chemical evolution of the fluids in a hydrothermal system. The concept of a flow-reaction path is particularly important where certain portions of mature hydrothermal systems may exhaust the buffer capacity of the rock as the primary mineralogy is consumed. In these instances 7 fluids traversing distinct regions within the hydrothermal system may experience very different reaction histories, even where the system can be described as nearly isothermal. The study of paleo-hydrothermal systems can yield some important insights into the chemical dynamics of hydrothermal systems in general. As an example of a paleo-hydrothermal system, we have considered the geochemical evolution of "porphyry-copper" type mineralization.

33972 (DOE/FTR–93016211) **Program for climate model diagnosis and intercomparison: Foreign trip report, April 28, 1993–May 14, 1993.** Grotch, S.L. Lawrence Livermore National Lab., CA (United States). 10 Jun 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93016211. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveller spent time in the United Kingdom, Germany, and Italy. In Bracknell, U.K., the traveller explored the possibilities of obtaining observational data from the Hadley Centre for model validation studies at PCMDI. Presented a lecture, "The Use of Distributional Statistics in Model/Data Intercomparisons," on personal research and PCMDI's general studies on the intercomparison of observational and model data. The traveller had technical discussions on the Hadley Centre's current work with GCM's and in model verification. In Reading, U.K., the traveller explored the possibilities of obtaining observational data from the ECMWF for model validation studies at PCMDI. Presented a lecture, April 30th, "Some Non-Traditional Statistical Techniques for Model Intercomparisons," on personal research, and PCMDI's general studies on the intercomparison of observational and model data. Had technical discussions on European Centre's current work with GCM's and in model verification. In Wiesbaden, Germany, the traveler attended conference of the European Geophysical Society and presented a paper: "Statistical Intercomparison of Global Precipitation Data Sets." Explored with other attendees the availability of observational data for PCMDI's purposes. In Bologna, Italy, the traveller attended AMIP/FANGIO joint meeting. Served as chairman for one session. Participated in a panel discussion outlining PCMDI's validation data archive and discussed procedures for obtaining data. Explored with other attendees the availability of new observational data for PCMDI's purposes.

33973 (DOE/RW/00214–T2) **[Geotechnical Board activities and funding]: [Annual] activites report, July 1, 1992–June 30, 1993.** Smeallie, P.H. National Academy of Sciences - National Research Council, Washington, DC (United States). 23 Jul 1993. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90RW00214. Order Number DE93019208. Source: OSTI; NTIS; GPO Dep.

The Geotechnical Board, a part of the US National Research Council, which is the operating arm of the National Academy of Sciences and the National Academy of Engineering, serves to advise the federal government and others on issues where geotechnology can have an impact, such as environmental remediation and infrastructure development. The board met three times during the reporting period to review current projects and to initiate activities that move the knowledge base of geotechnology forward. The board operates with two long-standing national committees, the US National Committee for Rock Mechanics and the US National Committee on Tunneling Technology. It also conducts special studies at the request of the government. A list of attachments is given.

33974 (EGG-NPR–10691-App.1-3) **Analysis of geodetic leveling data in the vicinity of the Idaho National Engineering Laboratory: Main report, Appendices 1–3.** Pelton, J.R. (Boise State Univ., ID (United States). Center for Geophysical Investigation of the Shallow Subsurface). EG and G Idaho, Inc., Idaho Falls, ID (United States); Boise State Univ., ID (United States). Center for Geophysical Investigation of the Shallow Subsurface. Sep 1991. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93019051. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Analysis of geodetic leveling data for 19 lines (6 first-order, 13 second-order) observed between 1906 and 1983 by the national geodetic survey (NGS) in the vicinity of the Idaho National Engineering Laboratory (INEL) are presented. A list of the geodetic leveling instructions issued by the NGS is given. Systematic errors are discussed to include: Rod-temperature error, residual rod-scale error, refraction error, level-collimation error, tidal error, and magnetic error. Statistical models of random error are reviewed, The sum of forward and backward discrepancies and circuit closures are analyzed. A discussion of errors in individual lines is given. Crustal movements from Idaho Falls to Humphrey, Idaho Falls to Pocatello, Chilly to Arco, Arco to Blackfoot, and Howe to Picabo are documented. The first three appendices are included and contain : Rod construction, scribing, graduation, and calibration; residual rod-scale error; and cumulative sum of forward and backward discrepancies. The fourth appendix is found in three separate volumes.

33975 (EGG-NPR–10691-App.4-Pt.1) **Analysis of geodetic leveling data in the vicinity of the Idaho National Engineering Laboratory: Appendix 4, Part 1.** Pelton, J.R. (Boise State Univ., ID (United States). Center for Geophysical Investigation of the

Shallow Subsurface). EG and G Idaho, Inc., Idaho Falls, ID (United States); Boise State Univ., ID (United States). Center for Geophysical Investigation of the Shallow Subsurface. Sep 1991. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93019052. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Analysis of geodetic leveling data for 19 lines (6 first-order, 13 second-order) observed between 1906 and 1983 by the National Geodetic Survey (NGS) in the vicinity of the Idaho National Engineering Laboratory (INEL) is presented. This appendix contains REDUC4 output for Pocatello to Butte, Dubois to Picabo, Chilly to Blackfoot, Chilly to Arco, Terreton to Roberts, and various locations around Blackfoot.

Center for Geophysical Investigation of the Shallow Subsurface. 23 Sep 1991. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93019054. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Analysis of geodetic leveling data for 19 lines (6 first-order, 13 second-order) observed between 1906 and 1983 by the National Geodetic Survey (NGS) in the vicinity of Idaho National Engineering Laboratory are presented. REDUC4 output for the individual lines: L21136, L21145, and L24756 are given.

33978 (JAB–10733-TM7) **Processed seismic motion records from Desert Hot Springs, California earthquake of April 22, 1992, recorded at seismic stations in southern Nevada.** Lum, P.K.; Honda, K.K. URS/John A. Blume and Associates, Engineers, San Francisco, CA (United States). Apr 1993. 196p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-89NV10733. Order Number DE93018071. Source: OSTI; NTIS; GPO Dep.

For complete package including technical report and 8mm data file, Order no. DE93018072.

As part of the contract with the US Department of Energy, Nevada Field Office (DOE/NV), URS/John A. Blume & Associates, Engineers (URS/Blume) maintains a network of seismographs in southern Nevada to monitor the ground motion generated by the underground nuclear explosions (UNEs) at the Nevada Test Site (NTS). The seismographs are located in the communities surrounding the NTS and the Las Vegas valley. When these seismographs are not used for monitoring the UNE generated nations, a limited number of seismographs are maintained for monitoring motion generated by other than UNEs (e.g. motion generated by earthquakes, wind, blast). During the subject earthquake of April 22nd 1992, a total of 19 of these systems recorded the earthquake motions. This report contains the recorded data.

33979 (JAB–10733-TM8) **Processed seismic motion records from Little Skull Mountain, Nevada earthquake aftershocks of July 5, 1992 and September 13, 1992, recorded at seismic stations in southern Nevada.** Lum, P.K.; Honda, K.K. URS/John A. Blume and Associates, Engineers, San Francisco, CA (United States). Apr 1993. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-89NV10733. As part of the contract with the US Department of Energy, Nevada Field Office (DOE/NV), URS/John A. Blume & Associates, Engineers (URS/Blume) maintains a network of seismographs in southern Nevada to monitor the ground motion generated by the underground nuclear explosions (UNEs) at the Nevada Test Site (NTS). The seismographs are located in the communities surrounding the NTS and the Las Vegas valley. When these seismographs are not used for monitoring the UNE generated motions, a limited number of seismographs are maintained for monitoring motion generated by other than UNEs (e.g. motion generated by earthquakes, wind, blast). During the subject earthquake aftershocks of July 5 and September 13, 1992, a total of 20 of these systems recorded the earthquake motions. This report contains the recorded data.

33983 (LBL-PUB–728) **DOE workshop: Sedimentary systems, aqueous and organic geochemistry.** Lawrence Berkeley Lab., CA (United States). Jul 1993. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9307107–: DOE workshop: sedimentary systems, aqueous and organic geochemistry, Berkeley, CA (United States), 15-16 Jul 1993). Order Number DE93018532. Source: OSTI; NTIS; INIS; GPO Dep.

A DOE workshop on sedimentary systems, aqueous and organic geochemistry was held July 15-16, 1993 at Lawrence Berkeley Laboratory. Papers were organized into several sections: Fundamental Properties, containing papers on the thermodynamics of brines, minerals and aqueous electrolyte solutions; Geochemical Transport, covering 3-D imaging of drill core samples, hydrothermal geochemistry, chemical interactions in hydrocarbon reservoirs, fluid flow model application, among others; Rock-Water Interactions, with presentations on stable isotope systematics of fluid/rock interaction, fluid flow and petotectonic evolution, grain boundary transport, sulfur incorporation, tracers in geologic reservoirs, geothermal controls on oil-reservoir evolution, and mineral hydrolysis kinetics; Organic Geochemistry covered new methods for constraining time of hydrocarbon migration, kinetic models of petroleum formation, mudstones in burial diagenesis, compound-specific carbon isotope analysis of petroleums, stability of natural gas, sulfur in sedimentary organic matter, organic geochemistry of deep ocean sediments, direct speciation of metal by optical spectroscopies; and lastly, Sedimentary Systems, covering sequence stratigraphy, seismic reflectors and diagenetic changes in carbonates, geochemistry and origin of regional dolomites, and evidence of large comet or asteroid impacts at extinction boundaries.

33984 (SAND–93-0256) **Event triggered data acquisition in the Rock Mechanics Laboratory.** Hardy, R.D. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018686. Source: OSTI; NTIS; GPO Dep.

Increasing complexity of experiments coupled with limitations of the previously used computers required improvements in both hardware and software in the Rock Mechanics Laboratories. Increasing numbers of input channels and the need for better graphics could no longer be supplied by DATAVG, an existing software package for data acquisition and display written by D. J. Holcomb in 1983. After researching the market and trying several alternatives, no commercial program was found which met our needs. The previous version of DATAVG had the basic features needed but was tied to obsolete hardware. Memory limitations on the previously used PDP-11 made it impractical to upgrade the software further. With the advances in IBM compatible computers it is now desirable to use them as data recording platforms. With this information in mind, it was decided to write a new version of DATAVG which would take advantage of newer hardware. The new version had to support multiple graphic display windows and increased channel counts. It also had to be easier to use.

33985 (UCRL-ID–113516) **Protocol for computation of surface boundary layer parameters used to determine soil moisture flux from meteorological data collected at LLNL, 1992–93.** Gouveia, F. Lawrence Livermore National Lab., CA (United States). Mar 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018906. Source: OSTI; NTIS; GPO Dep.

Starting May 1992, meteorological data is continuously collected for Environmental Restoration Division (ERD) at the LLNL weather-tower site. Mounted on a 2-meter mast are sensors for air temperature, wind speed and direction, relative humidity, net radiation flux, and ground heat flux. Table 1 lists the height of the sensors and the sensor accuracies. These sensors are sampled every second and 15-minute averages are saved by the data logger for retrieval. Average and standard deviation (σ_θ) of wind direction are computed by the Campbell logger (Campbell Scientific, Model CR-10) using polar coordinates as described in Yamartino (1984). This report describes the reduction of continuously monitored data from 15-minute averages to hourly averages. The bulk of this report is dedicated to describing the computation of parameters that characterize the surface boundary layer. The ultimate goal is to provide estimates of the amount of evaporation of water from the surface.

MIMD massively parallel computers promise unique power and flexibility for engineering and scientific simulations. In this paper we review the development of a number of software methods and algorithms for scientific and engineering problems which are helping to realize that promise. We discuss new domain decomposition, load balancing, data layout and communications methods applicable to simulations in a broad range of technical field including signal processing, multi-dimensional structural and fluid mechanics, materials science, and chemical and biological systems.

33987 (ANL-HEP-CP–93-39) **Thermodynamic q-distributions that aren't.** Vokos, S. (Washington Univ., Seattle, WA (United States). Dept. of Physics); Zachos, C. Argonne National Lab., IL (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ;FG06-91ER40614. (CONF-9306203–1: 2. Prague colloquium on quantum groups, Prague (Czech Republic), 24-26 Jun 1993). Order Number DE93017385. Source: OSTI; NTIS; INIS; GPO Dep.

Bosonic q-oscillators commute with themselves and so their free distribution is Planckian. In a cavity, their emission and absorption rates may grow or shrink-and even diverge-but they nevertheless balance to yield the Planck distribution via Einstein's equilibrium method, (a careless application of which might produce spurious q-dependent distribution functions). This drives home the point that the black-body energy distribution is not a handle for distinguishing q-excitations from plain oscillators. A maximum cavity size is suggested by the inverse critical frequency of such emission/absorption rates at a given temperature, or a maximum temperature at a given frequency. To remedy fragmentation of opinion on the subject, we provide some discussion, context, and references.

33989 (INIS-RU–352, pp. 12-15) **On the polarization invariance of the quantum light fields.** Karasev, V.P. AN SSSR, Moscow (Russian Federation). Fizicheskij Inst. 1991. (In Russian). In *Short communications on physics. Experimental and theoretical physics. No. 6.* 42p. Order Number DE94600073. Source: OSTI; NTIS (US Sales Only); INIS.

Polarization properties of light fields were studied. The notion of polarization spin (P-spin) describing double polarization degeneracy of energy-pulsed eigenstates is used to characterize polarization structure of quantum light fields and to reveal its sufficiently quantum peculiarities. A new class of light field states is obtained. The definite similarity of such states with nonpolarized light is noted. Differing from the classic nonpolarized light the P-scalar light is not a result of chaotic mixing of light waves, but it is generated by biphotons having rigid phase correlations. The two-photon laser or circuits of parametric scattering with $SU(2)_p$-invariant interaction Hamiltonians can be ideal generators of P-scalar light.

33990 (LA-UR–93-1562) **Application of Differential Sensitivity Theory to continuum mechanics.** Maudlin, P.J.; Henninger, R.J.; Harstad, E.N. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-931121–6: Annual winter meeting of the American Society of Mechanical Engineers, New Orleans, LA (United States), 28 Nov - 3 dec 1993). Order Number DE93012732. Source: OSTI; NTIS; GPO Dep.

A sensitivity technique used successfully in the early eighties called Differential Sensitivity Theory (DST) is applied to a system of time-dependent continuum mechanics equations. DST uses adjoint techniques to determine exact sensitivity derivatives, i.e., if R is a calculational result of interest (response R) and α is a calculational input (parameter α_i where the subscript is usually not indicated for convenience), then $\partial R/\partial\alpha_i$ is defined as the sensitivity. The advantage of using DST over other sensitivity analysis techniques is mainly economic: for an n-parameter problem all n sensitivities can be obtained by integrating the solutions from only two calculations, a so-called forward (physical) calculation and its corresponding adjoint calculation. This work describes the derivation and solution of the appropriate set of adjoint and sensitivity equations for the ultimate purpose of computing sensitivities for high-rate twodimensional, multi-component, high deformation problems.

33991 (LUND-MPH–93-02) **Resonant state expansions.** Lind, P. Lund Univ. (Sweden). Dept. of Mathematical Physics. Feb 1993. 46p. Order Number DE94600353. Source: OSTI; NTIS; INIS.

The completeness properties of the discrete set of bound state, virtual states and resonances characterizing the system of a single nonrelativistic particle moving in a central cutoff potential is investigated. From a completeness relation in terms of these discrete states and complex scattering states one can derive several Resonant State Expansions (RSE). It is interesting to obtain purely discrete expansion which, if valid, would significantly simplify the treatment of the continuum. Such expansions can be derived using Mittag-Leffler (ML) theory for a cutoff potential and it would be nice to see if one can obtain the same expansions starting from an eigenfunction theory that is not restricted to a finite sphere. The RSE of Greens functions is especially important, e.g. in the continuum RPA (CRPA) method of treating giant resonances in nuclear physics. The convergence of RSE is studied in simple cases using square well wavefunctions in order to achieve high numerical accuracy. Several expansions can be derived from each other by using the theory of analytic functions and one can the see how to obtain a natural discretization of the continuum. Since the resonance wavefunctions are oscillating with an exponentially increasing amplitude, and therefore have to be interpreted through some regularization procedure, every statement made about quantities involving such states is checked by numerical calculations.Realistic nuclear wavefunctions, generated by a Wood-Saxon potential, are used to test also the usefulness of RSE in a realistic nuclear calculation. There are some fundamental differences between different symmetries of the integral contour that defines the continuum in RSE. One kind of symmetry is necessary to have an expansion of the unity operator that is idempotent. Another symmetry must be used if we want purely discrete expansions. These are found to be of the same form as given by ML. (29 refs.).

33994 (LA-UR–93-2515) **Development of a cryogenic heat pipe.** Prenger, F.C.; Stewart, W.F.; Runyan, J.E. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930703–13: International cryogenic engineering conference and international cryogenic materials conference, Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE93018448. Source: OSTI; NTIS; GPO Dep.

Heat pipe operating characteristics can be used to advantage in cryogenic systems. Diode operation of the heat pipe, the ability to conduct heat in one direction only, is useful in protecting the heat load if the heat sink temperature rises above the load temperature. Because of this, the heat pipe can be made to act as a thermal switch. A screened-wick, inverted-artery, cryogenic heat pipe was designed, fabricated, and tested. The tests were first conducted with hydrogen and then with oxygen as the working fluid. Heat pipe performance limits were measured as a function of operating temperature, and startup from both the supercritical and the frozen state was demonstrated. The heat pipe was designed to operate as a thermal diode, and transient tests were used to determine the turndown ratio. The heat pipe test results were correlated with the Los Alamos heat pipe computer code and good agreement was obtained between the predicted and measured performance. The heat pipe was developed for spacecraft sensor cooling applications. Test results show significant performance advantages over solid conductors.

33995 (UCRL-ID--112216) **MODIL cryocooler producibility demonstration project results.** Cruz, G.E.; Franks, R.M. Lawrence Livermore National Lab., CA (United States). 24 Jun 1993. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019213. Source: OSTI; NTIS; INIS; GPO Dep.

The production of large quantities of spacecraft needed by SDIO will require a cultural change in design and production practices. Low rates production and the need for exceedingly high reliability has driven the industry to custom designed, hand crafted, and exhaustingly tested satellites. These factors have mitigated against employing design and manufacturing cost reduction methods commonly used in tactical missile production. Additional challenges to achieving production efficiencies are presented by the SDI spacecraft mission requirement. IR sensor systems, for example, are comprised of subassemblies and components that require the design, manufacture, and maintenance of ultra precision tolerances over challenging operational lifetimes. These IR sensors demand the use of reliable, closed loop, cryogenic refrigerators or active cryocoolers to meet stringent system acquisition and pointing requirements. The authors summarize some spacecraft cryocooler requirements and discuss their observations regarding Industry's current production capabilities of cryocoolers. The results of the Lawrence Livermore National Laboratory (LLNL) Spacecraft Fabrication and Test (SF and T) MODIL's Phase I producibility demonstration project are presented. The current project that involves LLNL and industrial participants is discussed.

33997 (DOE/ER/40317--12) **[Research in nuclear astrophysics: Stellar collapse and supernovae].** State Univ. of New York, Stony Brook, NY (United States). [1993]. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER40317. Order Number DE93019932. Source: OSTI; NTIS; GPO Dep.

This progress report describes the nuclear astrophysics research activities in the Earth and Space Sciences Department at Stony Brook during the last year. Our research focuses on three aspects of nuclear astrophysics: (1) the equation of state of hot, dense matter, (2) the origin of supernovas and neutron stars, (3) the early cooling epoch of neutron stars. Following a discussion of ongoing research, a series of detailed reports, which summarize each project completed within the last year, is given.

33998 (DOE/ER/40702--3) **Investigation of the relative abundance of heavy versus light nuclei in primary cosmic rays using underground muon bundles.** Sundaralingam, N. Tufts Univ., Medford, MA (United States). Dept. of Physics and Astronomy. 8 Jun 1993. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER40702. Order Number DE93017601. Source: OSTI; NTIS; INIS; GPO Dep.

We study multiple muon events (muon bundles) recorded underground at a depth of 2090 mwe. To penetrate to this depth, the muons must have energies above 0.8 TeV at the Earth's surface; the primary cosmic ray nuclei which give rise to the observed muon bundles have energies at incidence upon the upper atmosphere of 10 to 10^5TeV. The events are detected using the Soudan 2 experiment's fine grained tracking calorimeter which is surrounded by a 14 m $\times$10 m $\times$ 31 m proportional tube array (the "active shield"). Muon bundles which have at least one muon traversing the calorimeter, are reconstructed using tracks in the calorimeter together with hit patterns in the proportional tube shield. All ionization pulses are required to be coincident within 3 microseconds. A goal of this study is to investigate the relative nuclear abundances in the primary cosmic radiation around the "knee" region (10^3 – 10^4 TeV) of the incident energy spectrum. Four models for the nuclear composition of cosmic rays are considered: The Linsley model, the Constant Mass Composition model (CMC), the Maryland model and the Proton-poor model. A Monte Carlo which incorporates one model at a time is used to simulate events which are then reconstructed using the same computer algorithms that are used for the data. Identical cuts and selections are applied to the data and to the simulated events.

33999 (LA-UR--93-2541) **Computational astrophysics: Pulsating stars.** Davis, C.G. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9309176--2: 2. international conference on computational physics, Beijing (China), 13-17 Sep 1993). Order Number DE93018369. Source: OSTI; NTIS; INIS; GPO Dep.

The field of computational astrophysics in pulsating star studies has grown considerably since the advent of the computer. Initially calculations were done on the IBM 704 with 32K of memory and now we use the CRAY YMP computers with considerably more memory. Our early studies were for models of pulsating stars using a 1D Lagrangian hydrodynamic code (SPEC) with radiation diffusion. The radiative transfer was treated in the equilibrium diffusion approximation and the hydrodynamics was done utilizing the approximation of artificial viscosity. The early calculations took many hours of 704 CPU time. Early in 1965 we decided to improve on the usual treatment of the radiative transfer used in our codes by utilizing the method of moments, the so-called variable Eddington approximation. In this approximation the material energy field is uncoupled from the radiation energy field and the angular dependence is introduced through the Eddington factor. A multigroup frequency dependent method may also be applied. The Eddington factor is determined by snapshots of the stars structure utilizing a y-line approximation. The full radiative transfer approximation appears necessary in order to understand the light curves for W Virginia stars and may be important for the light curves of RR Lyrae stars. A detailed radiative transfer method does not appear to be necessary for the understanding of Cepheid light curves. A recent improvement to our models for Pulsating stars is in the use of an adaptive mesh scheme to resolve the sharp features in the nonlinear hydrodynamic structure. From these improved structures, better analysis of the radius, velocity, and light curves could be obtained.

34000 (LBL--34240) **Extensions of 2D gravity.** Sevrin, A. Lawrence Berkeley Lab., CA (United States). Jun 1993. 14p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant PHY90-21139. (UCB-PTH--93/21;CONF-9304184--1: Journees relativistes conference, Brussels (Belgium), 5-7 Apr 1993). Order Number DE93018525. Source: OSTI; NTIS; INIS; GPO Dep.

After reviewing some aspects of gravity in two dimensions, I show that non-trivial embeddings of sl(2) in a semi-simple (super) Lie algebra give rise to a very large class of extensions of 2D gravity. The induced action is constructed as a gauged WZW model and an exact expression for the effective action is given.

34001 (SAND–91-1144) **Fast parallel algorithms for short-range molecular dynamics.** Plimpton, S. Sandia National Labs., Albuquerque, NM (United States). May 1993. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018519. Source: OSTI; NTIS; GPO Dep.

Three parallel algorithms for classical molecular dynamics are presented. The first assigns each processor a subset of atoms; the second assigns each a subset of inter-atomic forces to compute; the third assigns each a fixed spatial region. The algorithms are suitable for molecular dynamics models which can be difficult to parallelize efficiently – those with short-range forces where the neighbors of each atom change rapidly. They can be implemented on any distributed-memory parallel machine which allows for message-passing of data between independently executing processors. The algorithms are tested on a standard Lennard-Jones benchmark problem for system sizes ranging from 500 to 10,000,000 atoms on three parallel supercomputers, the nCUBE 2, Intel iPSC/860, and Intel Delta. Comparing the results to the fastest reported vectorized Cray Y-MP and C90 algorithm shows that the current generation of parallel machines is competitive with conventional vector supercomputers even for small problems. For large problems, the spatial algorithm achieves parallel efficiencies of 90% and the Intel Delta performs about 30 times faster than a single Y-MP processor and 12 times faster than a single C90 processor. Trade-offs between the three algorithms and guidelines for adapting them to more complex molecular dynamics simulations are also discussed.

34002 (SAND–93-0457C) **Dynamical behavior of octahedrite from the Henbury meteorite.** Furnish, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Gray, G.T. III; Remo, J.L. Sandia National Labs., Albuquerque, NM (United States). 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930676–26: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93018834. Source: OSTI; NTIS; GPO Dep.

A suite of dynamic property measurements and characterization studies on an iron-nickel single crystal from the Henbury octahedrite containing Widmanstaetten intergrowths of kamacite and taenite (initial density 7.810) has been performed. These measurements include six impact tests (wave profile compression/release) over the stress range 2-20 GPa, metallography, quasi-static and Hopkinson bar mechanical testing, and ultrasonic mapping and sound velocity measurements. A cryogenic impact test was included to evaluate effects of a brittle/ductile transition which has been reported at 200K. Temperature sensitivity of the dynamic behavior was measured at high and low strain rates. The impact test results show loading strength (HEL), Hugoniot and $\alpha \rightarrow \varepsilon$ transition signatures to be similar to those for Armco iron, and do not show evidence for a ductile-brittle transition at these extremely high strain rates. Metallographic analyses, quasi-static and Hopkinson bar testing suggest that the material is in a work-hardened state and that kamacite properties dominate the bulk octahedrite properties.

34003 (SAND–93-0916C) **Visualization for applications in shock physics.** Pavlakos, C.J.; Campbell, D.L. Sandia National Labs., Albuquerque, NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-931080–1: Visualization '93, San Jose, CA (United States), 25-29 Oct 1993). Order Number DE93012849. Source: OSTI; NTIS; GPO Dep.

This case study presents work being done to provide visualization capabilities for a family of codes at Sandia in the area of shock physics. The codes, CTH and Parallel CTH, are running in traditional supercomputing as well as massively parallel environments. These are Eulerian codes which produce data on structured grids. Data sets can be large, so managing large data is a priority. A supercomputing-based distributed visualization environment has been implemented to support such applications. This environment, which is based in New Mexico, is also accessible from our branch site in California via a long haul FDDI/ATM link. Functionality includes the ability to track ongoing simulations. A custom visualization file has been developed to provide efficient, interactive access to result data. Visualization capabilities are based on the commercially available AVS software. A few example results are presented, along with a brief discussion of future work.

34004 (SAND–93-1388) **Using computerized tomography to determine ionospheric structures: Part 1, Motivation and basic approaches.** Vittitoe, C.N. Sandia National Labs., Albuquerque, NM (United States). Aug 1993. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018903. Source: OSTI; NTIS; GPO Dep.

Properties of the ionosphere are reviewed along with its correlations with other geophysical phenomena and with applications of ionospheric studies to communication, navigation, and surveillance systems. Computer tomography is identified as a method to determine the detailed, three-dimensional distribution of electron density within the ionosphere. Several tomography methods are described, with a basic approach illustrated by an example. Limitations are identified.

34005 (SAND–93-1389) **Using computerized tomography to determine ionospheric structures: Part 2, A method using curved paths to increase vertical resolution.** Vittitoe, C.N. Sandia National Labs., Albuquerque, NM (United States). Aug 1993. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018904. Source: OSTI; NTIS; GPO Dep.

A method is presented to unfold the two-dimensional vertical structure in electron density by using data on the total electron content for a series of paths through the ionosphere. The method uses a set of orthonormal basis functions to represent the vertical structure and takes advantage of curved paths and the eikonical equation to reduce the number of iterations required for a solution. Curved paths allow a more thorough probing of the ionosphere with a given set of transmitter and receiver positions. The approach can be directly extended to more complex geometries.

34006 (UCRL–53809-92) **Institute of Geophysics and Planetary Physics, 1992: Annual report, October 1, 1991–September 30, 1992.** Ryerson, F.J.; Budwine, C.M. (eds.). Lawrence Livermore National Lab., CA (United States). 14 Jun 1993. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019209. Source: OSTI; NTIS; GPO Dep.

This report contains brief discussions on topics in the following areas: High-pressure sciences; astrophysics; and geosciences.

34007 (UCRL–93018172) **Nonlinear self-focus of pulsed-wave beams in Kerr media.** Judkins, J.B. Lawrence Livermore National Lab., CA (United States). 1992. 186p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018172. Source: OSTI; NTIS; GPO Dep.

Thesis submitted to Univ. of Arizona, Tucson, AZ.

A modified finite-difference time-domain method for solving Maxwell's equations in nonlinear media is presented. This method allows for a finite response time to be incorporated in the medium, physically creating dispersion and absorption mechanisms. The technique models electromagnetic fields in two space dimensions and time and encompasses both the TE_z and TM_z set of decoupled field equations. Aspects of an ultra-short pulsed Gaussian beam are studied in a variety of linear and nonlinear environments to demonstrate that the methods developed here can be used efficaciously in the modeling of pulses in complex problem space geometries even when nonlinearities are present.

34008 (UCRL-ID–114560) **Determining the refractive index of a $\lambda/4$ thin film on a thick substrate from a transmittance measurement.** Chow, R.; Loomis, G.E.; Biltoft, P. Lawrence Livermore National Lab., CA (United States). Jun 1993. 12p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019584. Source: OSTI; NTIS; GPO Dep.

The refractive index is a key optical constant required by optical thin film designers. The coater-designer team must constantly verify the refractive indices of the non-absorbing optical thin films since the refractive index of a deposited material can vary by switching coating systems or operators as well as expected changes during the course of a coating run. A transmittance measurement on a spectrophotometer is an easy and accurate (usually to within ±0.5% spread) method of determining the refractive index. In one technique, the refractive index is obtained from visually curve-fitting a calculated (using a thin film design program and selecting the refractive index) transmittance spectrum to the measured transmittance spectrum. There are two other techniques which are discussed in this report: A quick, approximate method vs. the exact derivation. What the authors have not been able to find in the literature is the exact transmittance dependence as a function of the refractive indices (layers) through which the light passes and which accounts for the substrate back reflections. There are undocumented approximation methods as well as one in the literature by Cheremukhin and Rozhnox. Otherwise, most texts either derive the transmittances through optical multilayers or just the effect of back reflections on the transmittance for thick substrates. Without correcting for substrate back reflections, the derived refractive indices from the measured transmittances are in error by as much as 10%. In this work, the authors have utilized both an exact and an approximate method of determining the refractive index of the film. It is found that both the exact and approximate methods of determining the refractive index of thin optical coatings are within the measurement errors of commercially available spectrophotometers.

34009 (UCRL-JC–112660) **The tracking of interfaces in an electron-beam vaporizer.** Westerberg, K.W. (Lawrence Livermore National Lab., CA (United States)); McClelland, M.A.; Finlayson, B.A. Lawrence Livermore National Lab., CA (United States). Mar 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930785–2: 8. international conference on numerical methods in laminar and trubulent flow, Swansea (United Kingdom), 18-23 Jul 1993). Order Number DE93017975. Source: OSTI; NTIS; INIS; GPO Dep.

A numerical analysis is made of the material and energy flow in an electron beam vaporizer. In this system the energy from an electron beam heats metal confined in a water-cooled crucible. Metal is vaporized from a liquid pool circulating in a shell of its own solid. A modified Galerkin finite element method is used to calculate the flow and temperature fields along with the interface locations. The mesh is parameterized with spines which stretch and pivot as the phase boundaries move. The discretized equations are arranged in an "arrow" matrix and solved using the Newton-Raphson method. Results are given for an experimental aluminum vaporizer. The effects of buoyancy and capillary driven flow are included along with the surface contributions of vapor thrust, latent heat, thermal radiation, and crucible contact resistance.

34010 (UCRL-JC–113625) **Flow volumes for interactive vector field visualization.** Max, N.; Becker, B.; Crawfis, R. Lawrence Livermore National Lab., CA (United States). 6 Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-931080–2: Visualization '93, San Jose, CA (United States), 25-29 Oct 1993). Order Number DE93017102. Source: OSTI; NTIS; GPO Dep.

Flow volumes are the volumetric equivalent of stream lines. They provide more information about the vector field being visualized than do stream lines or ribbons. Presented is an efficient method for producing flow volumes, composed of transparently rendered tetrahedra, for use in an interactive system. The problems of rendering, subdivision, sorting, rendering artifacts, and user interaction are dealt with.

34011 (UCRL-JC–113747) **Weak neutral currents and collapse initiated supernova.** Wilson, J.R. Lawrence Livermore National Lab., CA (United States). 19 Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930293–4: International symposium on 30 years of neutral currents, Los Angeles, CA (United States), 3-5 Feb 1993). Order Number DE93018652. Source: OSTI; NTIS; GPO Dep.

Since 1974 the neutrino processes mediated by neutral currents have been a part of supernova (SN) modeling calculations. In this report only present day SN calculations will be discussed. First I will give brief description of the SN computer model and an outline of the explosion process as depicted by that model. Then I will discuss the role weak neutral current (WNC) processes play in this explosion process. Finally, I will discus inelastic scattering of tau neutrinos by heavy elements in WNC or Earth as a mechanism for measuring the mass of tau neutrino.

This report contains a description of the following: AGS Experimental Area - High Energy Physics FY 1993 and Heavy Ion Physics FY 1993; Table of Beam Parameters and Fluxes; Experiment Schedule "as run"; Proposed 1993 Schedule; A listing of experiments by number; Two-page summaries of each experiment begin here, also ordered by number; Publications of AGS Experiments; and List of AGS Experimenters.

34014 (DOE/ER/40319–T3) **High energy physics program: Task A, Experiment and theory; Task B, Numerical simulation: Progress report, July 1, 1988–June 30, 1993.** Florida State Univ., Tallahassee, FL (United States). Dept. of Physics. [1993]. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40319. Order Number DE93018140. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses research in High Energy Physics at Florida State University. Contained in this paper are: highlights of activities during the past few years; five year summary; fixed target experiments; collider experiments; SSC preparation, detector development and detector construction; computing, networking and VAX upgrade to ALPHA; and particle theory programs.

34015 (DOE/ER/40676–T1) **Research in particle physics.** Boston Univ., MA (United States). Dept. of Physics. Aug 1993. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40676. Order Number DE93040875. Source: OSTI; NTIS; INIS; GPO Dep.

This proposal presents the research accomplishments and ongoing activities of Boston University researchers in high energy physics. Some changes have been made in the structure of the program from the previous arrangement of tasks. Task B, Accelerator Design Physics, is being submitted as a separate proposal for an independent grant; this will be consistent with the nature of the research and the source of funding. We are active in seven principal areas which will be discussed in this report: Colliding Beams - physics of e^+e^- and $\bar{p}p$ collisions; MACRO Experiment - search for magnetic monopoles and study of cosmic rays; Proton Decay - search for nucleon instability and study of neutrino interactions; Particle Theory - theoretical high energy particle physics, including two Outstanding Junior Investigator awards; Muon G-2 - measurement of the anomalous magnetic moment of the muon; SSCintcal -

calorimetry for the GEM Experiment; and Muon detectors for the GEM Experiment.

After a brief review of the assumptions of the Minimal Supersymmetric Model (MSSM) we study the constraints on the masses of various sparticles as well as on the MSSM Higgs bosons from experiments at the Fermilab Tevatron and at LEP. We also review the range of Higgs boson masses that can be searched for at LEP 200. We then discuss the simulation of supersymmetric particle production at hadron colliders and briefly discuss event generators that we have been using in our analyses. Next, we discuss various signals that can be searched for in the present run of the Tevatron. We conclude with a study of the prospects for the detection of sparticles as well as MSSM Higgs bosons in experiments at hadron supercolliders, assuming that these are too heavy to be discovered at the Tevatron or at LEP 200.

34023 (DOE/ER/10713–T5) **Investigations in gauge theories, topological solitons and string theories: Final report.** Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). [1993]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AS05-80ER10713. Order Number DE93015029. Source: OSTI; NTIS; INIS; GPO Dep.

This is the Final Report on a supported research project on theoretical particle physics entitled "Investigations in Gauge Theories, Topological Solitons and String Theories." The major theme of particle theory pursued has been within the rubric of the standard model, particularly on the interplay between symmetries and dynamics. Thus, the research has been carried out primarily in the context of gauge with or without chiral fermions and in effective chiral lagrangian field theories. The topics studied include the physical implications of abelian and non-abelian anomalies on the spectrum and possible dynamical symmetry breaking in a wide range of theories. A wide range of techniques of group theory, differential geometry and function theory have been applied to probe topological and conformal properties of quantum field theories in two and higher dimensions, the breaking of global chiral symmetries by vector-like gauge theories such as QCD,the phenomenology of a possibly strongly interacting Higgs sector within the minimal standard model, and the relevance of solitonic ideas to non-perturbative phenomena at SSC energies.

34024 (DOE/ER/40682–23) **Testing the superweak theory of CP violation in neutral B decays.** Soares, J.M.; Wolfenstein, L. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. 21 Jan 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40682 ;AC02-76ER03066. (CMU-HEP–92-01). Order Number DE93018866. Source: OSTI; NTIS; INIS; GPO Dep.

In order to rule out the superweak theory for CP violation, future experiments will try to find a difference between the CP-violating asymmetries in the decays $B^0 \rightarrow \psi K_s$ and $B^0 \rightarrow \pi^+\pi^-$. However, Winstein recently noted that, for some acceptable values of the CKM parameters, the standard model would give equal asymmetry parameters for these decays just as the superweak theory does. In this paper we show that, by considering both tree and penguin contributions to the decay amplitudes, the test can still be effective if a third asymmetry is measured with enough precision.

34025 (DOE/FTR–93014982) **Travel to Japan for the 15th meeting of US/Japan Committee on High Energy Physics: Foreign trip report, May 31–June 1, 1993.** Rubinstein, R. Fermi National Accelerator Lab., Batavia, IL (United States). 4 Jun 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93014982. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report contains a review of the 15th meeting of the US/Japan committee an High Energy Physics.

34026 (FNAL/C–93/157-E) **SUSY searches at CDF.** Hu, Ping. CDF collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1993. 16p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9303203–1: SUSY 93 workshop, Boston, MA (United States), 29 Mar - 1 apr 1993). Order Number DE93017812. Source: OSTI; NTIS; INIS; GPO Dep.

A set of jet events with large amount of Missing E_{Tau} from the Fermilab CDF experiment was analyses to search for SUSY signature. No significant signals were observed above the Standard Model background. Some effects of some SUSY parameters on the squark and gluino mass limits are presented.

34027 (IC–93/165) **BRST operator for superconformal algebras with quadratic nonlinearity.** Khviengia, Z. (Texas A and M Univ., TX (United States). Center for Theoretical Physics); Sezgin, E. International Centre for Theoretical Physics, Trieste (Italy). Jul 1993. 13p. (CTP-TAMU–27/93,hep-th/9307043.). Order Number DE94600358. Source: OSTI; NTIS (US Sales Only); INIS.

We construct the quantum BRST operators for a large class of superconformal and quasi-superconformal algebras with quadratic nonlinearity. The only free parameter in these algebras is the level of the (super) Kac-Moody sector. The nilpotency of the quantum BRST operator imposes a condition on the level. We find this condition for (quasi) superconformal algebras with a Kac-Moody sector based on a simple Lie algebra and for the $Z_2 \times Z_2$-graded superconformal algebras with a Kac-Moody sector based on the superalgebra osp(N modul 2M) or sl (N + 2 modul N). (author). 22 refs, 3 tabs.

34028 (LITH-MAT-R–93-05) **A new conformal-invariant nonlinear spinor equation.** Fushchych, W.; Shtelen, W.; Basarab-Horwath, P. Linkoeping Univ. (Sweden). Dept. of Mathematics. 3 Feb 1993. 10p. Order Number DE94600360. Source: OSTI; NTIS; INIS.

We propose a new model for a spinor particle, based on a nonlinear Dirac equation. We invoke group invariance and use symmetry reduction in order to obtain a multiparameter family of exact solutions of the proposed equation. (authors).

34029 (OUP–93-09) **A connection between plane and cylindrical symmetry in general relativity.** Jensen, B.; Kucera, J. Oslo Univ. (Norway). Fysisk Inst. May 1993. 7p. Order Number DE94600359. Source: OSTI; NTIS; INIS.

A new static and singularity free solution of Einsteins equations, representing an infinitely long and straight hollow cylinder of finite thickness, is presented. The cylinder wall is composed of an incompressible, perfect fluid. The metric inside the wall is obtained from a known plane symmetric solution. This metric is matched smoothly to two different axisymmetric Kasner vacuum solutions. The vacuum on one side of the cylinder has a non-vanishing intrinsic curvature, while the vacuum on the other side is flat and non-simply connected. 4 refs.

34030 (BUP–1992-15) **Global features of relativistic heavy ion collisions at SPS, RHIC and LHC energies in string fusion model.** Bravina, L.V. (Bergen Univ. (Norway)); Csernai, L.P.; Amelin, N.S.; Braun, M.A.; Pajares, C. Bergen Univ. (Norway). Dept. of Physics. Oct 1992. 16p. Order Number DE94600365. Source: OSTI; NTIS; INIS.

Global characteristics of hh, hA and AA collisions at SPS, RHIC and LHC energies are examined within the Monte Carlo string fusion model (SFM). The possible influence of string fusion on the basic features of relativistic heavy ion collisions is studied. Particularly, in AA interactions at ultra-relativistic energies, string fusion can lead to a reduction of multiple production with relative enhancement of the baryon component. 25 refs., 4 figs., 1 tab.

34031 (FNAL/C–93/163-E) **QCD tests and new physics search with jets at CDF.** Zanetti, A.M. (Istituto Nazionale di Fisica Nucleare, Trieste (Italy)). CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9303171–5: 28. Recontres de Moriond conference on electroweak interaction and unified theories, Les Arcs (France), 13-20 Mar 1993). Order Number DE93017805. Source: OSTI; NTIS; INIS; GPO Dep.

The dijet invariant mass spectrum at a center of mass energy $\sqrt{s}$ = 1.8 TeV measured at the Tevatron Collider by CDF in the 1988–1989 run is presented. Comparison with leading order and next-to-leading order QCD theoretical calculation is performed. A search for a possible quark compositeness and for axigluons, while not showing evidence for new physics, allows one to put limits on the compositeness mass scale K_c and on the axigulon mass M_a. Preliminary results for the inclusive jet and the total transverse energy cross section from the high statistics data collected in the present run are shown.

34032 (INS–965) **Nucleon-nucleon scattering lengths in QCD sum rules.** Kondo, Y.; Morimatsu, O. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Feb 1993. 14p. Order Number DE93520239. Source: OSTI; NTIS; INIS.

Nucleon-nucleon scattering lengths are calculated using QCD sum rules. The calculation is based on the observation that the coefficient of the second-order pole term of the nucleon correlation function is proportional to the nucleon-nucleon scattering length at the threshold. By applying the Borel sum rules, we express the scattering length in terms of the expectation values of the quark-gluon field operators with respect to the one-nucleon state. The scattering lengths calculated are in qualitative agreement with the experiment. It is also shown that in the linear density approximation the nucleon mass shift in nuclear matter is related to the nucleon-nucleon scattering length. It is concluded that the recent calculations of the effective nucleon mass in nuclear matter using QCD sum rules with linear density approximation for the condensates should be interpreted in this way. (author).

34033 (KFKI–1992-31/A) **Multi-heavy baryons in ultrarelativistic heavy ion collisions.** Levai, P.; Zimanyi, J. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Nov 1992. 14p. Order Number DE94600366. Source: OSTI; NTIS (US Sales Only); INIS.

Multi-heavy baryon yields in heavy ion collisions were calculated using an extended version of combinatoric break-up model for the description of hadron formation, and for the prediction of the coalescence probability of two or three charm quarks. The combinatoric break-up model, describing the rehadronisation of the quark-gluon matter, needs the quark and gluon content of the very high energy density matter before rehadronisation as an input. An estimation for the expected number of multi-charmed baryons (with two or three heavy quarks) in the RHIC and LHC colliders is presented. (R.P.) 7 refs.; 2 figs.; 2 tab.

34034 (LUNFD6-TFME–1025-1-14-1993) **Aspects of the QCD cascade.** Olsson, Magnus. Lund Univ. (Sweden). Dept. of

Theoretical Physics. Feb 1993. 17p. Order Number DE94600364. Source: OSTI; NTIS; INIS.

A model is proposed for the production of transverse jets from diffractively excited protons. We propose that transverse jets can be obtained from gluonic bremsstrahlung in a way similar to the emission in DIS. Qualitative agreement is obtained between the model and the uncorrected data published by the UA8 collaboration. Perturbative QCD in the MLLA approximation is applied to multiple jet production in e^+e^--annihilation. We propose modified evolution equations for deriving the jet cross sections, defined in the 'k_t' or 'Durham' algorithm. The mean number of jets as a function of the jet resolution is studied, and analytical predictions are compared to the results of MC simulations. We also study a set of differential-difference equations for multiplicity distributions in e^+e^--annihilations, supplemented with appropriate boundary conditions. These equations take into account nonsingular terms in the GLAP splitting functions as well as kinematical constraints related to recoil effects. The presence of retarded terms imply that the cascade develops more slowly and reduces the fluctuations. The solutions agree well with MC simulations and experimental data. (authors).

34035 (ANL-HEP-CP–93-24) **Inverse neutrinoless double β-decay at the NLC?.** Rizzo, T.G. Argonne National Lab., IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930449–1: International workshop on physics and instrumentation at future linear colliders, Kona, HI (United States), 26-30 Apr 1993). Order Number DE93017397. Source: OSTI; NTIS; INIS; GPO Dep.

The NLC may allow us to search for the 'inverse' process to neutrinoless double-β decay, $e^-e^- \rightarrow W^-W^-$, which probes the existence of Majorana masses for neutrinos. Expectations for the observation of this process in both the Standard Model and its extension, the Left-Right Symmetric Model, are examined.

34036 (ANL/PHY/CP–80056) **Unitary $\pi\pi$N model of N* excitations in πN and γN reactions.** Lee, T.S.H. Argonne National Lab., IL (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305241–2: 6. international workshop on perspectives in intermediate energy nuclear physics, Trieste (Italy), 4-7 May 1993). Order Number DE93017422. Source: OSTI; NTIS; INIS; GPO Dep.

A unitary model is presented to describe N* excitations in πN and γN reactions. Preliminary results of πN scattering in P_{11} and P_{33} channels are compared with the data.

34037 (BUP–1992-01) **Two-loop ladder diagram contributions to Bhabha scattering. II: Asymptotoc results for high energies.** Bjoerkevoll, K.S. (Bergen Univ., Dept. of Physics (Norway)); Osland, P.; Faeldt, G. Bergen Univ. (Norway). Dept. of Physics. 1992. 37p. Order Number DE94600369. Source: OSTI; NTIS; INIS.

The authors determine the dominant contribution to the Bhabha scattering amplitudes arising from the six two-loop ladder-like diagrams in the limit $s>>t>>m^2>>\lambda^2$, where λ is the photon mass. A method is developed that allows for the simultaneous presence of these four different scales. While each individual diagram contributes four logarithmic factors to the amplitude, the two leading orders cancel, leaving only two such factors in the sum. They are precisely the logarithmic terms associated with two infrared photons. Integrals are also given for the terms that could possibly give single logarithms, but their sum is expected to vanish. 9 refs.

34038 (BUP–1992-06) **Two-loop ladder diagram contributions to Bhabha scattering. III: The Φ^3-limit of QED.** Bjoerkevoll, K.S. (Bergen Univ., Dept. og Physics (Norway)); Osland, P.; Faeldt, G. Bergen Univ. (Norway). Dept. of Physics. 1992. 30p. Order Number DE94600370. Source: OSTI; NTIS; INIS.

The authors evaluate, in the high-energy limit, the sum of the Feynman amplitudes corresponding the six two-loop ladder-like diagrams in Bhabha scattering. This is the limit where $s\rightarrow\infty$, while t, the electron mass m and the photon mass λ are all being held fixed. In this limit the sum of the six Feynman amplitudes does not depend on the electron mass. When specialized to the region $s>>t>>m^2>>\lambda^2$, this result complements the one previously obtained. The connection with Φ^3 theory is also investigated. 6 refs.

34039 (DOE/ER/40368–4) **Studies of high energy phenomena using muons: Final progress report.** Hedin, D.; Kaplan, D.; Green, J. Northern Illinois Univ., De Kalb, IL (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-87ER40368. Order Number DE93013190. Source: OSTI; NTIS; INIS; GPO Dep.

This report covers the activities of the NIU high energy physics group as supported by DOE contract AC02-87ER40368 during the period from July of 1990 to June of 1991 and from February to March 1992. Our group has three main efforts which will be discussed in this paper. The first is the D0 experiment at the Fermilab proton-antiproton collider, with major emphasis on its muon system. The second is the involvement of a portion of the group in Fermilab Experiment 789 which involved detection of meson decays. Finally, we discuss our work with the SDC collaboration at the SSC.

34040 (DOE/ER/40412–6) **The study of the phase structure of hadronic matter by searching for the deconfined quark-gluon phase transition using 2 TeV $\bar{p}$-p collisions; and by searching for critical phenomena in an exclusive study of multifragmentation using 1 GeV/nucleon heavy ion collisions: Progress report, January 1–December 31, 1993.** Scharenberg, R.; Hirsch, A.; Tincknell, M. Purdue Univ., Lafayette, IN (United States). Dept. of Physics. 15 Sep 1993. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER40412. Order Number DE93018925. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the Fermilab experiment E735 which is dedicated to the search for the quark-gluon plasma from proton-antiproton interactions; multifragmentation using the EOS-TPC; STAR R&D; silicon avalanche diodes as direct time-of-flight detectors; and soft photons at the AGS-E855.

34041 (DOE/FTR–93016212) **Travel to France for a seminar at DESY on early results from 1.8 TeV $\bar{p}p$ collisions at D0: Foreign trip report, March 7–21, 1993.** Demarteau, M. Fermi National Accelerator Lab., Batavia, IL (United States). 10 Jun 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93016212. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Preliminary results from D0 are presented on properties of the $W^{\pm}$ and Z^0 electroweak gauge bosons, using final states containing electrons and muons. In particular, preliminary measurements of the $W^{\pm}$ and Z^0 production cross sections with decay into final states containing electrons are shown and a status report on the determination of M_W/M_Z is given.

34042 (FNAL/C–93/088) **Charmonium physics from $\bar{p}p$ interactions.** Ray, R. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1993. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920847–2: International conference on hadron spectroscopy, College Park, MD (United States), 12-16 Aug 1992). Order Number DE93017809. Source: OSTI; NTIS; INIS; GPO Dep.

Heavy quarkonium is perhaps the best QCD laboratory in existence. Much of what we presently know about the fundamental interactions in nature has resulted from the study of two-body bound states. The hydrogen atom, the deuteron and positronium have provided valuable mechanisms for studying quantum mechanics, the theory of nuclear forces and QED. In the same way, one might hope that the study of two-body bound state systems built from heavy quarks will lead to a detailed understanding of at least some of the fundamental properties of strong interactions. While it is possible to gain some qualitative insights into strong interactions by studying bound states built from light quarks, it is not possible to reach more precise conclusions because of the additional complexities introduced by large relativistic corrections and long range confinement. Charmonium, $c\bar{c}$ bound states, has provided us with the first QCD laboratory where the system could be considered to be at least approximately non-relativistic while at the same time lending itself to perturbative calculations. The substantial mass of the charmed quark ($m_c \sim 1.5$ GeV) corresponds to bound states

sufficiently small to begin to probe the asymptotically free component of the strong interaction. The study of $c\bar{c}$ as well as $b\bar{b}$ bound states has greatly enhanced our understanding of the strong interaction between elementary particles. The scope of this article will be to review what has been learned to date, particularly on the experimental front, as well as to look at what remains to be done.

34043 (FNAL/C–93/166-E) **Ratios of cross sections of carbon, calcium and lead at low x_{Bj} in inelastic muon scattering.** Carroll, T.J. (Illinois Univ., Chicago, IL (US)). E665 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930363–5: 28. conference on quantum chromodynamics and high energy hadronic interactions, Les Arcs (France), 13-27 Mar 1993). Order Number DE93017810. Source: OSTI; NTIS; INIS; GPO Dep.

Shadowing is observed in the per nucleon cross sections of carbon, calcium and lead, as compared to deuterium. Preliminary cross section ratios are presented in the kinematic region $x_{Bj} > 0.0001$ and $Q^2 \geq 0.1$. The data were taken by Fermilab experiment E665 using inelastically scattered events from muons of mean incident momentum 468 GeV/c.

This document provides a brief introduction to the PAPAGENO partonic Monte-Carlo event generator.

34051 (TRI-PP–90-71) **Measurements of NN → dπ near threshold.** Hutcheon, D.A. TRIUMF, Vancouver, BC (Canada). Sep 1990. 9p. (CONF-9009332–: Conference on particle production near threshold, Nashville, IN (United States), 30 Sep - 3 oct 1990). Order Number DE94600374. Source: OSTI; NTIS (US Sales Only); INIS.

New, precise measurements of the differential cross sections for $np \rightarrow d\pi^0$ and $\pi^+ d \rightarrow pp$ and of analyzing powers for $pp \rightarrow d\pi^+$ have been made at energies within 10 MeV (c.m.) of threshold. They allow the pion s-wave and p-wave parts of the production strength to be distinguished unambiguously, yielding an s-wave strength at threshold which is significantly smaller than the previously accepted value. There is no evidence for charge independence breaking nor for πNN resonances near threshold. (Author) (17 refs., 17 figs., tab.).

34055 (INIS-RU–352, pp. 16-19) **Contribution of even wave function dibaryons to electromagnetic processes.** Akhmedov, D.M.; Fil'kov, L.V. AN SSSR, Moscow (Russian Federation). Fizicheskij Inst. 1991. (In Russian). In *Short communications on physics. Experimental and theoretical physics. No. 6.* 42p. Order Number DE94600073. Source: OSTI; NTIS (US Sales Only); INIS.

The processes involving photons, namely, $\gamma d \rightarrow \gamma pn$, γd, $\pi+\gamma NN$ and $pn \rightarrow \pi+\gamma NN$, were investigated. The contributions of dibaryons $D(T=0,\ J^P=0^\pm)$, $D(0,\ 1^-)$, $D(1,\ 1^\pm)$ with mass $M<2m_N+m_\pi$ (where m_N and m_π are the masses of nucleon and pion respectively) into γd elastic scattering total cross section were calculated. The dibaryons satisfy the condition $(-1)^{T+S}$ P=1 (T is isospin, S is internal spin, P is the dibaryon parity). The $D(0,\ O^\pm)$ contributions into the processes $\gamma d \rightarrow \gamma d$, $\gamma d \rightarrow \gamma pn$ are very large: in the point M=2 GeV they are greater than the cross section of corresponding processes near resonance by the factor approximately equal 10^4. The cross sections of dibaryon production in the process $pn \rightarrow \pi^0 + \gamma pn$ were evaluated. The conclusion is made that the study into the processes $\gamma d \rightarrow \pi+\gamma NN$; $\gamma d \rightarrow \pi+NN$, $pn \rightarrow \pi+\gamma NN$ may give the information on the possibility of existence of dibaryons $D(1,\ 1^\pm)$, and the study into the processes $\gamma d \rightarrow \gamma d$, $\gamma d \rightarrow \gamma pn$ provides for revealing the existence of dibaryons $D(0,\ 0^\pm)$.

34056 (LA-UR–93-2644) **T violating neutron spin rotation asymmetry.** Masuda, Yasushiro. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305235–3: International workshop/time reversal invariance and parity violation in neutron physics, Dubna (Russian Federation), 4-7 May 1993). Order Number DE93018470. Source: OSTI; NTIS; INIS; GPO Dep.

A new experiment on T-violation is proposed, where a spin-rotating-neutron transmission through a polarized nuclear target is measuered. The method to control the neutron spin is discussed for the new T-violation experiment. The present method has possibility to provide us more accurate T-violation information than the neutron EDM measurement.

34057 (LA-UR–93-2659) **Neutrino mass, a status report.** Robertson, R.G.H. Los Alamos National Lab., NM (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9307114–1: 14. international workshop on weak interactions and neutrinos, Seoul (Korea, Republic of), 19-24 Jul 1993). Order Number DE93018467. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental approaches to neutrino mass include kinematic mass measurements, neutrino oscillation searches at rectors and accelerators, solar neutrinos, atmospheric neutrinos, and single and double beta decay. The solar neutrino results yield fairly strong and consistent indications that neutrino oscillations are occurring. Other evidence for new physics is less consistent and convincing.

34058 (LBL–34313) **Physics motivations for SSC/LHC detectors.** Hinchliffe, I. Lawrence Berkeley Lab., CA (United States). Jun 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9306176–5: Workshop on physics at current accelerators and the supercollider, Argonne, IL (United States), 2-5 Jun 1993). Order Number DE93019230. Source: OSTI; NTIS; INIS; GPO Dep.

In this talk, I review the some of the physics goals and simulation work done in the SSC and LHC experimental proposal. I select the processes that illustrate the strengths and weaknesses the proposed detectors.

The nuclear data progress from 1987 to 1990 in China were described. It includes nuclear data evaluations and nuclear data library development, development of theory method and code used for nuclear data calculation and evaluation, group constant generating and benchmark testing, nuclear data measurement; international activities and co-operations. These works were carried out by the Chinese Nuclear Data Center and the chinese Nuclear Data Coordination Network.

34060 (DOE/ER–0590) **Summaries of FY 1992 research in nuclear physics.** USDOE Office of Energy Research, Washington, DC (United States). Nuclear Physics Div. Jul 1993. 286p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93017934. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the research projects supported by the Division of Nuclear Physics in the Office of High Energy and Nuclear Physics during FY 1992. This Division is a component of the Office of Energy Research and provides about 85% of the funding for nuclear physics research in the United States. The objectives of the Nuclear Physics Program are two-fold: (1) to understand the interactions and structures of atomic nuclei and nuclear matter and the fundamental forces of nature as manifested in nuclear matter and (2) to foster application of this knowledge to other sciences and technical disciplines. These summaries are intended to provide a convenient guide for those interested in the research supported by the Division of Nuclear Physics. We remind the readers that this compilation is just an overview of the Nuclear Physics Program. What we attempt to portray correctly is the breadth of the program and level of activity in the field of nuclear physics research as well as the new capabilities and directions that continually alter the public face of the nuclear sciences. We hope that the limitations of space, constraints of fon-nat, and rigors of editing have not extinguished the excitement of the science as it was originally portrayed.

34061 (DOE/ER/40285–6) **A program in medium-energy nuclear physics: Progress report, August 1, 1991–August 31,**

1992. Berman, B.L.; Dhuga, K.S. George Washington Univ., Washington, DC (United States). Dept. of Physics. [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40285. Order Number DE93018145. Source: OSTI; NTIS; INIS; GPO Dep.

This report reviews progress on our nuclear-physics program for the last year, and includes as well copies of our publications and other reports for that time period. The structure of this report follows that of our 1991 Renewal Proposal and Progress Report: Sec. II outlines our research activities aimed at future experiments at CEBAF, NIKHEF, and Bates; Sec. III gives results of our recent research activities at NIKHEF, LAMPF, and elsewhere; Sec. IV provides an update of our laboratory activities at GWU, including the acquisition of our new Nuclear Detector Laboratory at our new Virginia Campus; and Sec. V is a list of our publications, proposals, and other reports. copies of those on medium-energy nuclear physics are reproduced in the Appendix.

34062 (DOE/ER/40285–T2) **A program in medium-energy nuclear physics: Progress report, September 1, 1992–June 30, 1993.** Berman, B.L.; Dhuga, K.S. George Washington Univ., Washington, DC (United States). Dept. of Physics. [1993]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40285. Order Number DE93018137. Source: OSTI; NTIS; INIS; GPO Dep.

This report reviews progress on our nuclear-physics program for the last ten months, and includes as well copies of our publications and other reports for that time period. The structure of this report follows that of our 1992 Progress Report: Sec. II outlines our research activities aimed at future experiments at CEBAF, NIKHEF, and Bates; Sec. III gives results of our recent research activities at NIKHEF, LAMPF, and elsewhere; Sec. IV provides an update of our laboratory activities at GWU, including those at our new Nuclear Detector Laboratory at our Virginia Campus; and Sec. V is a list of our publications, proposals, and other reports. Copies of those on medium-energy nuclear physics are reproduced in the Appendix. The highlight of the year has been the approval by the NIKHEF and CEBAF PACs of all three of the proposals we have submitted. These are "Recoil Polarization of the Neutron in the Reactions ^{3}He(e,e′n) and ^{4}He(e,e′n)," NIKHEF Proposal 93-09, "Photoreactions on ^{3}He," CEBAF Proposal 93-044, and "Photoabsorption and Photofission of Nuclei," CEBAF Proposal 93-019. The NIKHEF experiment involves the use of the High-Acceptance Recoil Polarimeter for detection and measurement of the polarization of the emitted neutron. We, together with our colleagues at Grenoble, are responsible for the design and construction of the wire chambers for this device; we have largely completed the design phase this past year. The CEBAF experiments involve the use of the Hall-B Photon Tagger for production of the monochromatic photon beam. We are responsible for the 432-scintillator focal-plane detector array for this device; again, most of the design work and some prototype testing have been completed this past year. In addition, we have continued to make progress on data analysis and publication of results of previous measurements at Bates, LAMPF, and NIKHEF.

34063 (DOE/ER/40561–110-INT93) **Institute for Nuclear Theory: Annual report No. 3, 1 March 1992–28 February 1993.** Haxton, W.; Bertsch, G.; Henley, E.M. Washington Univ., Seattle, WA (United States). [1993]. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. Order Number DE93017369. Source: OSTI; NTIS; INIS; GPO Dep.

This report briefly discussion the following programs of the Institute for Nuclear Theory: fundamental interactions in nuclei; strangeness in hadrons and nuclei; microscopic nuclear structure theory; nuclear physics in atoms and molecules; phenomenology and lattice QCD; and large amplitude collective motion.

6631 Nuclear Structure

34064 (BNL–49079) **A new simple global phenomenology of nuclear shape transitions.** Casten, R.F. (Brookhaven National Lab., Upton, NY (United States)); Zamfir, N.V.; Brenner, D.S. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ;FG02-88ER40417. (CONF-930534–2: 3. international conference on radioactive nuclear beams, East Lansing, MI (United States), 24-27 May 1993). Order Number DE93017577. Source: OSTI; NTIS; INIS; GPO Dep.

The energies of low-spin yrast states, $E(4_1^+)$, and the transition probabilities, $B(E2; 2_1^+ \rightarrow 0_1^+)$, that are among the most revealing and the easiest to measure observables of collectivity, show remarkable global correlations that change our understanding of nuclear structure and nuclear phase transitions and provide new signatures to identify particular structures. These signatures will be particularly valuable in the era of radioactive beams when the quantity of information available in newly-observed nuclei will be radically reduced compared to what we are accustomed to.

34065 (BNL–70084) **Travel to Germany to conduct research in nuclear physics and nuclear structure: Foreign trip report, October 29–December 22, 1991.** Casten, R.F. Brookhaven National Lab., Upton, NY (United States). 13 Jan 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93018255. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A number of basic research projects were carried out or initiated during this trip. Some of these focused on effective charges in valence models, a new region of O(6)-like nuclei, an extensive set of non-contiguous nuclei with identical rotational bands, signature splitting in negative parity states, an analysis of ^{114}Cd lifetime data, and some intriguing phenomenology in plots of $E(2_1^+)$ versus P.

34066 (DOE/ER/40270–42) **Investigations of the structure and electromagnetic interactions of few-body systems: Progress report, 1 July 1992–30 June 1993.** Lehman, D.R.; Haberzettl, H.; Maximon, L.C.; Parke, W.C.; Bennhold, C.; Ito, Hiroshi; Pratt, R.K.; Najmeddine, M.; Rakei, A. George Washington Univ., Washington, DC (United States). Center for Nuclear Studies. Jul 1993. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40270. Order Number DE93019596. Source: OSTI; NTIS; INIS; GPO Dep.

The emphasis of the nuclear theory group has been on the structure and electromagnetic interactions of few-body nuclei. Both low- and intermediate-energy electromagnetic disintegration of these nuclei is considered, including coherent photoproduction of π mesons. When the excitation energy of the target nucleus is low, the aim is to handle the continuum part of the theoretical work numerically with no approximations, that is, by means of full three- or four-body dynamics. When structure questions are the issue, numerically accurate calculations are always carried through, limited only by the underlying two-body or three-body interactions used as input. A central goal is to carry through state-of-the-art few-body calculations that will serve as a means of determining at what point standard nuclear physics requires introduction of relativity and/or quark degrees of freedom in order to understand the phenomena in question.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs., 2 tabs. IRIDIUM 192/excited states; NILSSON-MOTTELSON MODEL; PARITY; SPIN; THEORETICAL DATA

34089 (INIS-RU–347, pp. 106-107) **Rotational interpretation of ^{194}Ir.** Balodis, M. (AN Latvijskoj SSR, Riga (Latvia). Inst. Fiziki); Berzins, J.; Kramer, N.; Prokofjev, P.; Kern, J.; Edigy, T. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 7 refs., 1 tab. IRIDIUM 194/excited states; DEUTERON REACTIONS; EXPERIMENTAL DATA; GAMMA RADIATION; NEUTRON REACTIONS; PARITY; PROTONS; SPIN; THERMAL NEUTRONS

34090 (INIS-RU–347, pp. 109) **Mean-square radii and quadrupole moments of uranium isotopes.** Kuprikov, V.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Soznik, A.P.; Tarasov, V.N. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs., 1 tab. URANIUM ISOTOPES/nuclear radii; URANIUM ISOTOPES/quadrupole moments; EXPERIMENTAL DATA; HARTREE-FOCK METHOD; MASS NUMBER

34091 (INIS-RU–347, pp. 112) **Unified approach to description of the nuclear dynamics and properties of the ground state.** Khodel', V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Shaginyan, V.R. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. 1 ref. NUCLEAR MATTER/collective excitations; NUCLEAR MATTER/ground states; CORRELATIONS; NEUTRONS

34092 (INIS-RU–347, pp. 113) **Selection rules in isospin and the widths of high-excited states for light nuclei.** Zhusupov, M.A.; Usmanov, T.G. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. 2 refs. LIGHT NUCLEI/excited states; ISOSPIN; LEVEL WIDTHS; NUCLEAR DECAY; NUCLEONS; SELECTION RULES; SHELL MODELS

34093 (INIS-RU–347, pp. 114) **Role of nuclear relativism in calculations of magnetic form factors.** Kasymbalinov, R.N. (AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki). AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. EVEN-ODD NUCLEI/electromagnetic form factors; ODD-EVEN NUCLEI/electromagnetic form factors; DIRAC EQUATION; ENERGY LEVELS; NUCLEONS; RELATIVISTIC RANGE; WOODS-SAXON POTENTIAL

34094 (INIS-RU–347, pp. 115) **Microscopic description of the halo effect.** Gorbatov, A.M. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. NUCLEAR REACTIONS/cluster model; BOUND STATE; THRESHOLD ENERGY; WAVE FUNCTIONS

34095 (INIS-RU–347, pp. 116) **Wave function structure of the ^{6}He and ^{11}Li nuclei.** Gorbatov, A.M.; Kolganova, E.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. LITHIUM 11/wave functions; LITHIUM 6/wave functions; HYPERGEOMETRIC FUNCTIONS; NUCLEAR MATTER

34096 (INIS-RU–347, pp. 117) **Microscopic approach of point-mass density distribution of the ^{4}He nucleus.** Gorbatov, A.M.; Kolganova, E.A.; Komarov, P.V.; Nikishov, P.Yu.; Bursak, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. HELIUM 4/wave functions; NUCLEAR MATTER

34097 (INIS-RU–347, pp. 118) **Soft dipole resonance in ^{11}Li in three-particle cluster model with continuous spectrum.** Lur'e, Yu.A. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Smirnov, Yu.F.; Shirokov, A.M. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs. LITHIUM 11/excited states; CLUSTER MODEL; E1-TRANSITIONS; HEAVY NUCLEI; LITHIUM 11 REACTIONS; STRENGTH FUNCTIONS; SUM RULES; WAVE FUNCTIONS

34098 (INIS-RU–347, pp. 121) **Microscopic derivation of the collective Hamiltonian for quadrupole vibrations of even-even nuclei.** Vorov, O.K. (AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki). AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. EVEN-EVEN NUCLEI/excited states; COLLECTIVE MODEL; HAMILTONIANS

34099 (INIS-RU–347, pp. 122) **Linear relations between masses and Coulomb-energy differences of terms of isobaric multiplets.** Poplavskij, I.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. ISOBARIC NUCLEI/multiplets; COULOMB ENERGY; MULTIPLETS; ISOSPIN; MASS FORMULAE; RECURSION RELATIONS

34100 (INIS-RU–347, pp. 123) **Recursion mass formula for heavy even-even isotopes.** Poplavskij, I.V.; Popushoj, M.N. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs., 1 tab. HEAVY NUCLEI/mass formulae; CALIFORNIUM 240; CURIUM 236; FERMIUM 244; MASS; PLUTONIUM 230; POLONIUM 220; RADIUM 230; RADON 224; THEORETICAL DATA; THORIUM 236; URANIUM ISOTOPES; URANIUM 242

34101 (INIS-RU–347, pp. 125) **Spectra of the ^{9}Be and ^{9}B nuclei in the three-particle multicluster model.** Razikov, Kh.D. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. BERYLLIUM 9/energy levels; BORON 9/energy levels; ALPHA PARTICLES; CLUSTER MODEL; NUCLEONS; THREE-BODY PROBLEM

34102 (INIS-RU–347, pp. 126) **Construction of the effective NN-potential on data for the light, intermediate and heavy nuclei.** Simenog, I.V.; Steshenko, A.I. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 tab. MAGIC NUCLEI/nucleon-nucleon potential; CALCIUM 40; D STATES; HELIUM 4; OXYGEN 16; ROTATIONAL STATES; S STATES

34103 (INIS-RU–347, pp. 127) **Description of properties of finite final nuclei and nucleon-nucleus potentials on the base of NN potentials of the mesonic theory.** Pozdnyakov, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 5 refs. INTERMEDIATE MASS NUCLEI/binding energy; INTERMEDIATE MASS NUCLEI/nuclear radii; LEAD 208; NUCLEON-NUCLEON POTENTIAL; OBE MODEL

34104 (INIS-RU–347, pp. 128) **Description of properties of the neutron-rich nuclei in the hyperspherical function method.** Galakhmatova, B.S. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Kamchatnova, V.A.; Chernyaev, A.P.; Shitikova, K.V.; Yudin, S.N. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs., 1 tab. NEUTRON-RICH ISOTOPES/form factors; BINDING ENERGY; EXPERIMENTAL DATA; HYPERGEOMETRIC FUNCTIONS; LITHIUM 10; LITHIUM 11; LITHIUM 6; LITHIUM 7; LITHIUM 8; LITHIUM 9; NUCLEAR RADII

34105 (INIS-RU–347, pp. 130) **M4-excitations of ^{10}B.** Arakelyan, Eh.R. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation)); Goncharova, N.G. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 tabs. BORON 10/excited states; BORON 10/m4-transitions; M4-TRANSITIONS; ENERGY DEPENDENCE; FORM FACTORS; ISOVECTORS; PARITY; SPIN; THEORETICAL DATA

34106 (INIS-RU–347, pp. 131) **Isoscalar dipole states and the ^{18}O nucleus polarizability.** Gul'karov, I.S.; Karimov, M.G.; Nigmankhodzhaev, A.G. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs., 1 tab. OXYGEN 18/excited states; OXYGEN 18/e1-transitions; CHARGE DENSITY; LEVEL WIDTHS; E1-TRANSITIONS; PARITY; POLARIZABILITY; PROBABILITY; SPIN; THEORETICAL DATA

34107 (INIS-RU–347, pp. 132) **Explicit nuclear collective potential expression in the powers of elementary invariants.** Katkevicius, O. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs. COLLECTIVE MODEL/two-body problem; INVARIANCE PRINCIPLES; NUCLEAR POTENTIAL; NUCLEAR THEORY; NUCLEON-NUCLEON POTENTIAL

34108 (INIS-RU–347, pp. 133) **Vectorial interaction in the strictly restricted dynamics model.** Ruza, J. (AN Latvijskoj SSR, Riga (Latvia). Inst. Fiziki); Guseva, T.; Tambergs, J.; Alkaras, J.A.; Katkevicius, O. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs., 1 tab. MIRROR NUCLEI/excited states; NUCLEON-NUCLEON POTENTIAL; THEORETICAL DATA

34109 (INIS-RU–347, pp. 134) **SU_3 band mixing effects in the framework of strictly restricted dynamics model.** Katkevicius, O.; Ruza, J.; Guseva, T.; Tambergs, J.; Alcaras, J.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref., 1 tab. MAGNESIUM 24/excited states; SULFUR 32/excited states; ELLIOT MODEL; GAMMA RADIATION; SU-3 GROUPS; TRANSITION AMPLITUDES

34110 (INIS-RU–347, pp. 136) **Effective account of hexadecupole modes in the nuclear collective model with dynamical quadrupole deformations.** Porodzinskij, Yu.V.; Sukhovitskij, E.Sh. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. COLLECTIVE MODEL/nuclear deformation; ROTATIONAL STATES; VIBRATIONAL STATES

34111 (INIS-RU–347, pp. 137) **Rotational-vibrational excited states of deformed even-even nuclei.** Sharipov, Sh. (AN Uzbekskoj SSR, Tashkent (Uzbekistan). Inst. Yadernoj Fiziki); Nadyrbekov, M.S. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. EVEN-EVEN NUCLEI/rotational states; EVEN-EVEN NUCLEI/vibrational states; DEFORMED NUCLEI

34112 (INIS-RU–347, pp. 138) **Proton-neutron interactions and masses of nuclei with Z>N.** Avotina, M.P.; Lemberg, I.Kh. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. INTERMEDIATE MASS NUCLEI/mass; LIGHT NUCLEI/mass; MASS; MIRROR NUCLEI

34113 (INIS-RU–347, pp. 141) **Microscopic description of giant resonance widths in magic nuclei.** Kamerdzhiev, S.P. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Tertychnyj, G.Ya. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. MAGIC NUCLEI/giant resonance; CALCIUM 40; CALCIUM 48; ENERGY LEVELS; E0-TRANSITIONS; E2-TRANSITIONS; LEAD 208; LEVEL WIDTHS

34114 (INIS-RU–347, pp. 142) **Hartree-Fock potential of nuclear matter.** Kadmenskij, S.G.; Luk'yanovich, P.A.; Lyuboshits, V.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs. NUCLEAR MATTER/nuclear potential; EFFECTIVE MASS; HARTREE-FOCK METHOD; NUCLEON-NUCLEON POTENTIAL; NUCLEONS

34115 (INIS-RU–347, pp. 143) **Self-consistent potential of atomic nuclei and fragmentation effects.** Kadmenskij, S.G.; Luk'yanovich, P.A.; Lyuboshits, V.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. 2 refs. HEAVY NUCLEI/excited states; CORRELATIONS; HARTREE-FOCK METHOD; NUCLEAR POTENTIAL; OPTICAL MODELS; PARTICLE-HOLE MODEL; RESIDUAL INTERACTIONS; SPECTROSCOPIC FACTORS

34116 (INIS-RU–347, pp. 144) **Distribution of octupole force in deformed nuclei up to 6 MeV energy.** Solov'ev, V.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Sushkov, A.V.; Shirikova, N.Yu. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. 2 refs. EVEN-EVEN NUCLEI/deformed nuclei; EVEN-EVEN NUCLEI/e3-transitions; COLLECTIVE MODEL; E3-TRANSITIONS; EXCITED STATES; GADOLINIUM 158; QUASIPARTICLE-PHONON MODEL; STRENGTH FUNCTIONS; WAVE FUNCTIONS

34117 (INIS-RU–347, pp. 145) **Stochastic approach to description of nuclear collective motion.** Kolomiets, V.M. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Kondrat'ev, V.N. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. 1 ref. NUCLEI/collective model; NUCLEI/cranking model; DISSIPATION FACTOR; ENERGY-LEVEL DENSITY; MATRIX ELEMENTS; NUCLEAR TEMPERATURE; NUCLEI; RELAXATION TIME

34118 (INIS-RU–347, pp. 146) **Attenuation of nuclear zerosound as a delayed effect in kinetic equation.** Kolomiets, V.M. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Magner, A.G.; Plyujko, V.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. 1 ref. NUCLEAR MATTER/collision integrals; NUCLEAR MATTER/zero sound; COLLECTIVE EXCITATIONS; GREEN FUNCTION; KINETIC EQUATIONS; LANDAU DAMPING; NUCLEAR TEMPERATURE; VISCOSITY

34119 (INIS-RU–347, pp. 147) **Fermi surface deformation at giant monopole resonance.** Abrosimov, V.I. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Toro, M. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International Conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. 2 refs. HEAVY NUCLEI/nuclear deformation; INTERMEDIATE MASS NUCLEI/nuclear deformation; BOLTZMANN-VLASOV EQUATION; COLLECTIVE MODEL; COLLISION INTEGRALS; FERMI LEVEL; GIANT RESONANCE

34120 (INIS-RU–347, pp. 148) **Vibrational states effect on thermodynamic characteristics of heated nuclei.** Ezhov, S.N. (Kievskij Gosudarstvennyj Univ., Kiev (Ukraine)); Plyujko, V.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the conference on Perspectives in Nuclear Structure at the Niels Bohr Institute in Copenhagen. The talks at this conference covered a broad spectrum of topics in nuclear physics. Each speaker tended to review the status of a given area and to address the outlook for the future in that area. The Workshop on Nuclear Spectroscopy at the New Arrays held at the University of Lund, Sweden, concentrated on nuclear structure research where there are opportunities for significant new advancements as a result of the new large arrays of Compton-suppressed germanium detectors now being constructed. The speaker presented an invited tall on "A New Era of Lifetime Measurements With the Large Arrays."

6632 Radioactivity and Electromagnetic Transitions (Excluding Fission)

International Union of Pure and Applied Chemistry (IUPAC) meeting, Lisbon (Portugal), 5-12 Aug 1993). Order Number DE93019846. Source: OSTI; NTIS; INIS; GPO Dep.

The half-lives of a number of selected ground state radioactive nuclides have been evaluated and values have been recommended with uncertainties. These are all preliminary recommendations.

34154 (DOE/ER/40553–4) **Nuclear transparency and double beta decay of molybdenum 100: Annual progress report, February 1, 1993–January 31, 1994.** Nicholson, H.W. Mount Holyoke Coll., South Hadley, MA (United States). Jul 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER40553. Order Number DE93019861. Source: OSTI; NTIS; INIS; GPO Dep.

The analysis of the data obtained in an experiment to search for double beta decay in molybdenum 100 with collaborators from the Lawrence Berkeley Laboratory, the University of New Mexico, and the Idaho National Engineering Laboratory has nearly been completed, and a paper giving a lower limit of 0.44×10^{23} years on the lifetime of the $O^+ \rightarrow O_+$ neutrinoless doable beta decay mode has been accepted for publication in Physical Review Letters. A scintillating fiber beam hodoscope has been designed, built, and tested and used in the EVA detector during the June–July run of AGS Experiment 850 at the Brookhaven National Laboratory. The EVA detector is designed to study color transparency in nuclei and large angle exclusive reactions for momenta between 6 and 20 GeV/c incident beam momenta. At present, the construction of all systems of the EVA detector, which consists of a large superconducting solenoid, 5500 straw tubes arranged in four cylinders, and 500 trigger scintillation counters arranged in two rings and 100 channels of beam hodoscope, has nearly been completed, and the detector is currently being calibrated and is taking data at 6 GeV/c incident beam momentum. We have also been invited to join the NEMO international collaboration which is involved in a series of experiments to look for double beta decay in molybdenum 100. Professor Sutton is beginning to study the problems involved in purifying molybdenum 100 as a source for the NEMO 3 detector currently being designed.

34220 (BUP–1992-11) **Proton elastic scattering in neutron-halo nuclei.** Gareev, F.A. (Kurchatov Inst., Moscow (Russian Federation)); Goncharov, S.A.; Vaagen, J.S. Bergen Univ. (Norway). Dept. of Physics. 1992. 11p. Order Number DE94600402. Source: OSTI; NTIS; INIS.

Elastic scattering of proton from ^{6}Li and ^{6}He is studied in the intermediate energy region ($E_p \geq 100$ MeV) in a folding model with "realistic" target densities which reproduce the r.m.s. radii and a range of electroweak data. The scattering clearly reflects the size of the systems, but is only marginally able to discriminate between details of the correlated valence structures of the two nuclei. At forward angles where the direct fingerprint of the presence of a halo structure is expected, the cross section differences are small. At large angles where the response of the α-core on the halo structure is probed, the differences found are accompanied by a falling cross-section magnitude. Likewise, only a weak dependence is found to differences in the halo-tail corresponding to three calculations for ^{11}Li which all reproduce the experimental r.m.s. radius. 12 refs., 3 figs.

The distributions of the transverse energy and the multiplicity of charged particles in oxygen induced reactions are examined in the Fritiof Monte Carlo model. The shape of the distributions are found to be determined by the distribution of the number of particle-emitting sources, i.e. strings. The fluctuations in particle emission from each string is hidden by these much larger fluctuations. The fluctuations of these distributions when partial phase space coverage is used is well described by purely stochastic emission. Distributions of slow singly-charged fragments in the target region is measured for both hadron and oxygen induced reactions. The distributions extends to much larger values than simulated data from the Monte Carlo models Fritiof 1.7 and Venus 3.14. The hadron induced reactions give distributions that can be reproduced assuming that each participating target nucleon produced fragments according to a geometric distribution, where the average number of fragments per participating target nucleon is target dependent. The extracted average number of produced fragments are similar for proton and pion induced reactions. When the tails of the distributions are studied their extension can be parametrized, and for such an approach a target dependence of $A^{2/3}$ is found for all projectiles. The data for 60 and 200 A GeV are almost identical for distributions as well as angular and energy examined distributions. The angular distributions follow an exponential in $\cos(\theta)$. If the slopes of the angular distributions are examined and target dependences as well as centrality dependences are extracted. For light targets there is a strong target dependence, but for targets heavier than copper there is not any great differences. The centrality dependence is almost negligible for a gold-target but for a copper-target the most central collisions have more forward peaked distributions. (62 refs.).

(CONF-9304181–1: IAEA's coordinated research on

activation cross sections for the generation of long-lived and radionuclides of importance in fusion reactor technology, San Diego, CA (United States), 29-30 Apr 1993). Order Number DE93017745. Source: OSTI; NTIS; INIS; GPO Dep.

Four sample packets containing elemental Ti, Fe, Ni, Cu, Nb, Ag, Eu, Tb and Hf have been irradiated in three distinct accelerator neutron fields, at Argonne National Laboratory and Los Alamos National Laboratory, USA, and Japan Atomic Energy Research Institute, Tokai, Japan. The acquired experimental data include differential cross sections and integral cross sections for the continuum neutron spectrum produced by 7-MeV deuterons incident on thick Be-metal target. The U-238(n,f) cross section was also measured at 10.3 MeV as a consistency check on the experimental technique. This the third progress report on a project which has been carried out under the auspices of an IAEA Coordinated Research Program entitled "Activation Cross Sections for the Generation Of Long-lived Radionuclides of Importance in Fusion Reactor Technology". The present report provides the latest results from this work. Comparison is made between the 14.7-MeV cross-section values obtained from the separate investigations at Argonne and JAERI. Generally, good agreement observed within the experimental errors when consistent sample parameters, radioactivity decay data and reference cross values are employed. A comparison is also made between the experimental results and those derived from calculations using a nuclear model. Experimental neutron information on the Be(d,n) neutron spectrum was incorporated in the comparisons for the integral results. The agreement is satisfactory considering the various uncertainties that are involved.

34238 (BUP–1992-13) **Phase transition dynamics in ultra-relativistic heavy-ion collisions.** Csernai, L.P. (Bergen Univ. (Norway)); Kapusta, J.I.; Kluge, G.Y.; Zabrodin, E.E. Bergen Univ. (Norway). Dept. of Physics. Nov 1992. 25p. Order Number DE94600422. Source: OSTI; NTIS; INIS.

The authors investigate various problems related to the dynamics of a first-order phase transition from quark-gluon plasma to hadronic matter in ultra-relativistic heavy ion collisions. These include nucleation, growth and fusion of hadronic bubbles in either the Bjorken longitudinal hydrodynamic expansion model or the Cooper-Frye-Schonberg spherical hydrodynamic expansion model. With reasonable input parameters the conversion of one phase into the other is relatively close to the idealized adiabatic Maxwell construction, although one can choose parameters such that the conversion is strongly out of equilibrium. 10 refs., 7 figs.

34239 (BUP–1992-14) **Strangeness production in proton and heavy ion collisions at 200 A GeV.** Amelin, N.S. (Univ. of Frankfurt (Germany)); Bravina, L.V.; Csernai, L.P.; Toneev, V.D.; Gudima, K.K.; Sivoklokov, S.Y. Bergen Univ. (Norway). Dept. of Physics. Nov 1992. 27p. Order Number DE94600423. Source: OSTI; NTIS; INIS.

Strangeness production at SPS-CERN energies is studied within the Quark Gluon String Model. The observed shape of rapidity and transverse mass distributions are reproduced fairly well for both peripheral and central heavy ion collisions. However, for central collisions the model underpredicts strange particle abundances by a factor of about 2:2:4 for K_S^0, Λ and antiΛ, respectively. This discrepancy can be considered as a possible manifestation of collective string-string interactions similar to the formation of a color rope. Model predictions for coming experiments with the Pb beam at CERN are given. 30 refs. 11 figs., 3 tabs.

34240 (BUP–1992-16) **Direct experimental evidence for a soft dipole response in ^{6}He.** Sakuta, S.B. (Kurchatov Inst., Moscow (Russian Federation)); Ershov, S.N.; Vaagen, J.S. Russian - Nordic - British Theory Collaboration (RNBT). Bergen Univ. (Norway). Dept. of Physics. Dec 1992. 10p. Order Number DE94600421. Source: OSTI; NTIS; INIS.

The differential cross sections of the charge-exchange reaction ^{6}Li(^{7}Li,^{7}Be)^{6}He were measured at beam energies 78 and 82 MeV. In addition to the 0^+ bound state and sharp 2^+ resonance, three wide bumps were identified in the experimental continuum spectrum of ^{7}Be at small angles. The maximum at excitation energy of $\approx$ 6MeV is consistent with a soft dipole response, expected in nuclei with neutron halo. 23 refs., 2 figs.

34241 (CONF-9210173–7) **Computer codes for checking, plotting and processing of neutron cross-section covariance data and their application.** Sartori, E. (OECD/NEA Data Bank, Issy les Moulineaux (France)); Roussin, R.W. Oak Ridge National Lab., TN (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Nuclear Energy Agency Science Committee (NEANSC) specialists meeting on evaluation and processing of covariance data; Oak Ridge, TN (United States); 7-9 Oct 1992. Order Number DE93018459. Source: OSTI; NTIS; GPO Dep.

This paper presents a brief review of computer codes concerned with checking, plotting, processing and using of covariances of neutron cross-section data. It concentrates on those available from the computer code information centers of the United States and the OECD/Nuclear Energy Agency. Emphasis will be placed also on codes using covariances for specific applications such as uncertainty analysis, data adjustment and data consistency analysis. Recent evaluations contain neutron cross section covariance information for all isotopes of major importance for technological applications of nuclear energy. It is therefore important that the available software tools needed for taking advantage of this information are widely known as hey permit the determination of better safety margins and allow the optimization of more economic, I designs of nuclear energy systems.

34242 (CONF-9301109–4) **Experimental overview.** Plasil, F. Oak Ridge National Lab., TN (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international conference on physics and astrophysics of quark-gluon plasma; Calcutta (India); 19-23 Jan 1993. Order Number DE93018719. Source: OSTI; NTIS; INIS; GPO Dep.

Data from CERN/SPS and BNL/AGS experiments were reviewed, with emphasis on most recent results, including reactions with recently obtained Au ions.

The overall goal of this project is to study nucleus-nucleus collisions experimentally at intermediate and relativistic energies, with emphasis on measurement and interpretation of correlation effects that provide insight into the nuclear phase diagram and the nuclear equation of state. During the course of this reporting period, the PI returned to Kent from a 15-month leave at Lawrence Berkeley Lab, which had been devoted 100% to work on this research project. The EOS Time Projection Chamber at LBL's Bevalac accelerator has continued to be the major focus of research for all of the supported personnel; about a year ago, this detector successfully took data in production mode for the first time, and accumulated in excess of 1000 hours of beam time before the termination of the Bevalac in February 1993. Reduction and analysis of these data is currently our first priority. Effort has also been devoted to the STAR detector at the Relativistic Heavy Ion Collider, in the form of contributions to the Conceptual Design Report, work on HV control hardware and software for use with the STAR Time Projection Chamber, and tracking software development.

Short communication. GALLIUM 69 TARGET/proton reactions; PROTON REACTIONS/capture; CROSS SECTIONS; ENERGY-LEVEL TRANSITIONS; EXCITED STATES; GAMMA RADIATION; GROUND STATES; CAPTURE

34261 (INIS-RU–347, pp. 207) **Partial cross sections of the (p,n) reaction on ^{71}Ga.** Fedorets, I.D.; Zalyubovskij, I.N.; Ratkevich, S.S.; Nemashkalo, B.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. GALLIUM 71/excited states; GALLIUM 71 TARGET/proton reactions; CROSS SECTIONS; GAMMA SPECTRA; MEV RANGE 01-10; NEUTRONS; PARITY; SPIN

34262 (INIS-RU–347, pp. 208) **Energy dependence pf (antip,p')-scattering on Si with excitation of 2^+ and 3^- (T=0) states.** Plavko, A.V. (Leningradskij Gosudarstvennyj Univ., Leningrad (Russian Federation)); Kudryashov, V.I.; Olmer, K.; Shvandt, P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. SILICON 28 TARGET/proton reactions; DIFFERENTIAL CROSS SECTIONS; ENERGY DEPENDENCE; EXCITED STATES; MEV RANGE 100-1000; MOMENTUM TRANSFER; NUCLEON-NUCLEON INTERACTIONS; POLARIZATION-ASYMMETRY RATIO; POLARIZED BEAMS; PROTONS

34263 (INIS-RU–347, pp. 209) **Surface and inner excitation of 2^+ states in ^{28}Si in inelastic proton scattering.** Plavko, A.V. (Leningradskij Gosudarstvennyj Univ., Leningrad (Russian Federation)); Onegin, M.S.; Kaurov, V.N.; Olmer, K.; Shvandt, P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. SILICON 28/excited states; SILICON 28 TARGET/proton reactions; ANGULAR DISTRIBUTION; DIFFERENTIAL CROSS SECTIONS; INELASTIC SCATTERING; MEV RANGE 100-1000; NUCLEON-NUCLEON INTERACTIONS; PROTONS

34264 (INIS-RU–347, pp. 210) **Quasivibrational and nonvibrational 4^+ states of ^{56}Fe in the (antip,p') scattering at e_p=16 MeV.** Plavko, A.V. (Leningradskij Gosudarstvennyj Univ., Leningrad (Russian Federation)); Kudryashov, V.I.; Klegg, T.; Karvovski, Kh.; Varner, R.L. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. IRON 56/vibrational states; IRON 56 REACTIONS; MEV RANGE 01-10; MEV RANGE 10-100; POLARIZATION-ASYMMETRY RATIO; POLARIZED BEAMS; PROTON REACTIONS; PROTONS; SCATTERING

34265 (INIS-RU–347, pp. 213) **Excitation functions of the (p,n) reaction on zinc isotopes in the energy range E_p 4.9-5.9 MeV.** Vinogradov, V.M. (Leningradskij Gosudarstvennyj Univ., Leningrad (Russian Federation)); Zhuravlev, Yu.Yu.; Zarubin, P.P.; Kolozhvari, A.A.; Sergeev, V.O.; Sitnikova, I.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. ZINC 68 TARGET/proton reactions; ZINC 69/isobaric analogs; ZINC 70 TARGET/proton reactions; ZINC 71/isobaric analogs; EXCITATION FUNCTIONS; GAMMA SPECTRA; MEV RANGE 01-10; NEUTRONS; RESONANCE; TOTAL CROSS SECTIONS

34266 (INIS-RU–347, pp. 214) **Total cross sections from the (p,n) reaction on molybdenum isotopes at E_p=5-6 MeV.** Antropov, A.E. (Leningradskij Gosudarstvennyj Univ., Leningrad (Russian Federation)); Gusev, V.P.; Zhuravlev, Yu.Yu.; Zarubin, P.P.; Kolozhvari, A.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. MOLYBDENUM 94 TARGET/proton reactions; MOLYBDENUM 95 TARGET/proton reactions; MOLYBDENUM 96 TARGET/proton reactions; PROTON REACTIONS/total cross sections; ENERGY DEPENDENCE; GAMMA SPECTRA; MEV RANGE 01-10; NEUTRONS

34267 (INIS-RU–347, pp. 215) **Study of anomalous proton optical potential near Fermi energy.** Romanovskij, E.A. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Rafu, L.M.; Bespalova, O.V.; Belal', A.; Bogdanov, R.I. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. INTERMEDIATE MASS NUCLEI/proton reactions; PROTON REACTIONS/tin isotopes

34268 (INIS-RU–347, pp. 216) **Investigation of isotopic and shell effects in total cross sections of proton reactions.** Romanovskij, E.A. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Rafu, L.M.; Belal', A.; Bespalova, O.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. INTERMEDIATE MASS NUCLEI/proton reactions; PROTON REACTIONS/total cross sections

34269 (INIS-RU–347, pp. 217) **The role of final-state interaction of n+d subsystem in deuterium breakup reaction on deuterons at 13.6 MeV.** Sokolov, M.V. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij). AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. DEUTERIUM TARGET/deuteron reactions; DEUTERON REACTIONS/breakup reactions; PROTONS

34270 (INIS-RU–347, pp. 218) **Study of relative neutron and proton yields in the (p,pn) and (p,2p) reactions.** Voloshin, N.I.; Palkin, G.P.; Fursa, A.D.; Shostak, V.B. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. HELIUM 4 TARGET/proton reactions; PROTON REACTIONS/knock-out reactions; PROTON REACTIONS/nuclear reaction yield; HELIUM 3

34271 (INIS-RU–347, pp. 219) **On the mechanism of inelastic scattering according to the data on occupation probability of 2_1^+ level substates in the ^{24}Mg(p,p') reaction near resonance at E_p=5.903 MeV.** Lazarev, V.V. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Chubigskij, O.V.; Vinogradov, L.I. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. MAGNESIUM 24 TARGET/proton reactions; PROTON REACTIONS/elastic scattering; PROTON REACTIONS/inelastic scattering

34272 (INIS-RU–347, pp. 220) **Isotopic dependence of cross sections of neutron scattering on Ge and Se even isotopes.** Musaehlyan, R.M.; Popov, V.I.; Skorkin, V.M.; Surkova, I.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. GERMANIUM ISOTOPES/neutron reactions; NEUTRON REACTIONS/elastic scattering; NEUTRON REACTIONS/inelastic scattering; SELENIUM ISOTOPES/neutron reactions; OPTICAL MODELS

34273 (INIS-RU–347, pp. 221) **Comparison of two examples of a generalized optical model in the analysis of neutron cross sections for Te.** Musaehlyan, R.M.; Skorkin, V.M.; Surkova, I.V.; Yakovenko, T.I. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. NEUTRON REACTIONS/elastic scattering; NEUTRON REACTIONS/optical models; TELLURIUM ISOTOPES/neutron reactions; DIFFERENTIAL CROSS SECTIONS; TOTAL CROSS SECTIONS

34274 (INIS-RU–347, pp. 222) **On the mechanism of a regular spin splitting of cross sections and the Te(n,p)m Sn(p,n) reaction cross sections.** Gopych, P.M.; Sorokin, V.I. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs. NEUTRON REACTIONS/cross sections; PROTON REACTIONS/cross sections; TELLURIUM/neutron reactions; TIN ISOTOPES/proton reactions; MASS NUMBER; PARITY; TARGETS; TELLURIUM

34275 (INIS-RU–347, pp. 223) **Momentum transfer in mean energy proton reactions with heavy nuclei.** Gorshkov, T.Yu. (Radievyj Inst., Leningrad (Russian Federation)); D'yachenko, A.T.; Prokof'ev, A.V.; Smirnov, A.N.; Ehjsmont, V.P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. PROTON REACTIONS/fission; THORIUM 232 TARGET/proton reactions; URANIUM 233 TARGET/proton reactions; URANIUM 235 TARGET/proton reactions; URANIUM 238 TARGET/proton reactions; ENERGY DEPENDENCE; EXPERIMENTAL DATA; FISSION

34276 (INIS-RU–347, pp. 224) **Study of P-even angular asymmetry of ^{235}U fission fragments spread relatively to the direction of a slow neutron beam in the energy range 1 to 136 eV.** Gagarskij, A.M. (AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki); Golosovskij, S.P.; Laptev, A.B.; Petrov, G.A.; Petukhov, A.K.; Plava, Yu.S.; Sokolov, V.E.; Shcherbakov, O.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. NEUTRON REACTIONS/capture; NEUTRON REACTIONS/fission; URANIUM 235 TARGET/neutron reactions; CAPTURE; FISSION; P WAVES; S WAVES; SLOW NEUTRONS

34277 (INIS-RU–347, pp. 225) **Fission isomer yield in the (n,n') and (n,γ) reactions on ^{241}Am.** Makarenko, V.E.; Molchanov, Yu.D.; Otroshchenko, G.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. CARBON 12 TARGET/nitrogen 14 reactions; NITROGEN 14 REACTIONS/nuclear reaction kinetics

34346 (INIS-RU–347, pp. 306) **102-element isotope production in the ^{32}Ne+^{236}U and ^{26}Mg+^{232}Th reactions.** Andreev, A.N. (and others); Bogdanov, D.D.; Eremin, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 8 refs. THORIUM 232 TARGET/magnesium 26 reactions; URANIUM 236 TARGET/neon 22 reactions; NOBELIUM 253

34347 (INIS-RU–347, pp. 307) **Study on the nuclear fission in the region of the Busonaro-Gallone point.** Salamatin, V.S. (and others); Kozulin, Eh.M.; Tonchev, A.P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. CARBON 12 REACTIONS/fission; MAGNESIUM 25 REACTIONS/fission; NEON 20 REACTIONS/fission; FISSION; LIQUID DROP MODEL

34348 (INIS-RU–347, pp. 308) **Effect of angular momentum on mass and energy distributions of fission fragments.** Chubaryan, G.G. (and others); Luk'yanyuk, S.M.; Penionzhkevich, Yu.Eh. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs. ELEMENT 104/fission; POLONIUM/fission; FISSION; LIMITING VALUES; POLONIUM

34349 (INIS-RU–347, pp. 310) **On a possibility of a direct experimental observation of the delayed fission effect of excited heavy nuclei by means of the shadow method.** Platonov, S.Yu. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Fotina, O.V.; Yuminov, O.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. FRANCIUM 213/fission; GOLD 197 TARGET/oxygen 16 reactions; COMPOUND NUCLEI; FISSION

34350 (INIS-RU–347, pp. 312) **^{11}Li(29 MeV/nucleon) elastic scattering on silicon nuclei.** Ann, R. (and others); Gijmo-Myuller, D.; Kordyash, A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. SILICON 28 TARGET/lithium 11 reactions; LITHIUM 11; WOODS-SAXON POTENTIAL

34351 (INIS-RU–347, pp. 313) **Correlation method for study on nonbound states of nuclei in multi-particle heavy ion reactions.** Pavlenko, Yu.N. (and others); Pugach, V.M.; Kolomiets, I.N. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. NICKEL 64 TARGET/nitrogen 14 reactions; TIN 124 TARGET/nitrogen 14 reactions; ENERGY LEVELS

34352 (INIS-RU–347, pp. 315) **Rainbow scattering of radioactive nuclei.** Ogloblin, A.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. HEAVY ION REACTIONS/elastic scattering; HEAVY ION REACTIONS/inelastic scattering; ISOBARIC ANALOGS

34353 (INIS-RU–347, pp. 317) **^{178m2}Hf exotic nucleus-target and heavy ion reactions.** Oganesyan, Yu.P. (and others); Brianson, V.; Vollerskhajm, Kh. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. ERBIUM 170 TARGET/carbon 12 reactions; HAFNIUM 178/nuclear reaction yield; YTTERBIUM 176 TARGET/alpha reactions

34354 (INIS-RU–347, pp. 318) **Shell effects and production cross sections of the Fr, Ra, and Ac neutron-deficient isotopes with N=126 in the ^{197}Au+^{20},^{22}Ne reactions.** Andreev, A.N. (and others); Bogdanov, D.D.; Vremin, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 7 refs. ACTINIUM ISOTOPES/fission; FRANCIUM ISOTOPES/fission; GOLD 197 TARGET/neon 20 reactions; GOLD 197 TARGET/neon 22 reactions; RADIUM ISOTOPES/fission; FISSION

34355 (INIS-RU–347, pp. 319) **Diffractive structure of pion spectrum in ion-ion collisions.** Chernyshev, D.A. (Voronezhskij Gosudarstvennyj Univ., Voronezh (Russian Federation)); Kopytin, I.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. NICKEL 58 TARGET/nitrogen 14 reactions; PIONS/particle production; URANIUM 238 TARGET/carbon 12 reactions; DIFFERENTIAL CROSS SECTIONS; DIFFRACTION MODELS; MEV RANGE 100-1000; PIONS; THRESHOLD ENERGY

34356 (INIS-RU–347, pp. 320) **Emission of fast positrons and electrons in ion-ion collisions at intermediate energies.** Batkin, I.S. (Voronezhskij Gosudarstvennyj Univ., Voronezh (Russian Federation)); Kopytin, I.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. ELECTRONS/particle production; HEAVY ION REACTIONS; POSITRONS/particle production; CARBON 12 REACTIONS; DIFFERENTIAL CROSS SECTIONS; ELECTRONS; MEV RANGE 100-1000; NICKEL 58 TARGET; NITROGEN 14 REACTIONS; NUCLEAR POTENTIAL; OPTICAL MODELS; POSITRONS; URANIUM 238 TARGET

34357 (INIS-RU–347, pp. 321) **Elastic scattering of antiprotons on ^{4}He nucleus.** Zhusupov, M.A.; Ibraeva, E.T.; Peresypkin, V.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. ANTIPROTON REACTIONS/elastic scattering; HELIUM 4 TARGET/antiproton reactions; DIFFERENTIAL CROSS SECTIONS; GLAUBER THEORY; MEV RANGE 10-100; MEV RANGE 100-1000

34358 (INIS-RU–347, pp. 323) **Shell structure of ^{12}C nucleus and slow π^--meson absorption.** Ivankov, Yu.V. (Voronezhskij Gosudarstvennyj Univ., Voronezh (Russian Federation)); Kadmenskij, S.G. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. CARBON 12 TARGET/pion minus reactions; PION MINUS REACTIONS/absorption; BORON 10; ENERGY SPECTRA; NEUTRONS; NUCLEAR REACTION YIELD; PAIR PRODUCTION; ABSORPTION

34359 (INIS-RU–347, pp. 325) **Proton polarization in the $^{12}C(K^+, K_p^+)^{11}B$ reaction at 0.6 and 0.85 GeV/c initial kaons.** Berdnikov, Ya.A.; Shishlo, A.P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. CARBON 12 TARGET/kaon plus reactions; KAON PLUS REACTIONS/polarized products; BORON 11; KAONS PLUS; MEV RANGE 100-1000; PROTONS; RESCATTERING; SCATTERING AMPLITUDES; SPIN ORIENTATION

34360 (INIS-RU–347, pp. 326) **Proton polarization in the $d(K^+, K^+p)n$ reaction at 0.6 GeV/c kaon momentum.** Berdnikov, Ya.A.; Shishlo, A.P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. DEUTERIUM TARGET/kaon plus reactions; AMPLITUDES; FINAL-STATE INTERACTIONS; KAONS PLUS; MEV RANGE 100-1000; NEUTRONS; POLARIZED PRODUCTS; PROTONS; SPIN ORIENTATION

34361 (INIS-RU–347, pp. 327) **Exhibition of (d^*+p) configuration of ^3He in elastic p^3He backscattering at 0.5-1.7 GeV.** Lado, A.V. (Kazakhskij Gosudarstvennyj Univ., Alma-Ata (Kazakhstan)); Uznikov, Yu.N. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs. HELIUM 3 TARGET/proton reactions; PROTON REACTIONS/nuclear reaction kinetics; BACKSCATTERING; CLUSTER MODEL; ELASTIC SCATTERING; GEV RANGE 01-10; HELIUM 3; MEV RANGE 100-1000; WAVE FUNCTIONS

34362 (INIS-RU–347, pp. 328) **Exhibition of nodal structure of ^6LI nucleus cluster wave function in αd photodisintegration channel.** Burkova, N.A. (Kazakhskij Gosudarstvennyj Univ., Alma-Ata (Kazakhstan)); Zhaksybekova, K.A.; Zhusupov, M.A.; Ehramzhyan, R.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref., 2 figs. LITHIUM 6 TARGET/photonuclear reactions; PHOTONUCLEAR REACTIONS/breakup reactions; ALPHA PARTICLES; CLUSTER MODEL; DEUTERONS; E2-TRANSITIONS; TOTAL CROSS SECTIONS; WAVE FUNCTIONS

34363 (INIS-RU–347, pp. 329) **Method of dispersion integration on masses of complex particles in application to deuteron breakup.** Anisovich, A.V. (AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki); Sadovnikova, V.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs., 1 fig. DEUTERIUM TARGET/photonuclear reactions; PHOTONUCLEAR REACTIONS/breakup reactions; AMPLITUDES; IMPULSE APPROXIMATION; NUCLEAR MODELS; TOTAL CROSS SECTIONS

34364 (INIS-RU–347, pp. 330) **Influence of final-state interaction on cross section of deuteron photodisintegration.** Anisovich, A.V. (AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki); Sadovnikov, V.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs., 1 fig. DEUTERIUM TARGET/photonuclear reactions; PHOTONUCLEAR REACTIONS/breakup reactions; FINAL-STATE INTERACTIONS; NUCLEON-NUCLEON INTERACTIONS; TOTAL CROSS SECTIONS

34365 (INIS-RU–347, pp. 331) **T-matrix approximation for description of (d, dp) and $(\alpha, \alpha p)$ reactions on light nuclei at mean energies.** Golovin, A.V.; Loshchakov, I.I. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. ALPHA REACTIONS/s matrix; DEUTERON REACTIONS/s matrix; LIGHT NUCLEI/alpha reactions; LIGHT NUCLEI/deuteron reactions; DEUTERIUM TARGET; HELIUM 3 TARGET; HELIUM 4 TARGET; LITHIUM 6 TARGET; MATRIX ELEMENTS

34366 (INIS-RU–347, pp. 332) **Competition of the nucleon quasi-free knockout by mean-energy antinucleons and antinucleon annihilation in nuclei.** Zavarzina, V.P.; Stepanov, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. ANTIPROTON REACTIONS/annihilation; ANTIPROTON REACTIONS/knock-out reactions; ANNIHILATION; CROSS SECTIONS; HEAVY NUCLEI; INTERMEDIATE MASS NUCLEI; LIGHT NUCLEI; MEV RANGE 10-100; NUCLEONS; QUASI-FREE REACTIONS

34367 (INIS-RU–347, pp. 333) **On the polarized electron scattering by oriented nuclei.** Tartakovskij, V.K. (Kievskij Gosudarstvennyj Univ., Kiev (Ukraine)); Lyong Zuen Fu; Fursaev, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. ORIENTED NUCLEI/electron reactions; DIFFERENTIAL CROSS SECTIONS; ELECTRONS; POLARIZED BEAMS; POLARIZED PRODUCTS

34368 (INIS-RU–347, pp. 334) **Sensitivity analysis of reaction cross section and zero-angle scattering amplitude to structure of nuclear optical potential for 1.37 GeV alpha particles.** Zavarzina, V.P.; Stepanov, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. ALPHA REACTIONS/nuclear potential; POTASSIUM ISOTOPES/alpha reactions; ELASTIC SCATTERING; OPTICAL MODELS; SCATTERING AMPLITUDES; SENSITIVITY ANALYSIS; TOTAL CROSS SECTIONS

34369 (INIS-RU–347, pp. 335) **Common potential of hadron-nuclear interaction at particle energies $\leq$1 GeV in kinematically corrected impulse approximation.** Makhov, A.M. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. HADRON REACTIONS/impulse approximation; HADRON REACTIONS/nuclear potential; MEV RANGE 100-1000; OPTICAL MODELS; SCATTERING AMPLITUDES

34370 (INIS-RU–347, pp. 337) **Two-particle photodisintegration of three-nucleon nuclei and polarization phenomena at low energies.** Kozlovskij, I.V. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki); Gurin, Yu.L.; Malyarzh, E.M.; Tartakovskij, V.K. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. HELIUM 3 TARGET/photonuclear reactions; PHOTONUCLEAR REACTIONS/breakup reactions; TRITIUM TARGET/photonuclear reactions; DEUTERONS; MEV RANGE 10-100; NEUTRONS; POLARIZED BEAMS; POLARIZED PRODUCTS; PROTONS

34371 (INIS-RU–347, pp. 338) **Elastic scattering of antiprotons by ^{12}C and ^{16}O nuclei and α-cluster model with dispersion.** Berezhnoj, Yu.A. (Khar'kovskij Gosudarstvennyj Univ., Kharkov (Ukraine)); Mikhajlyuk, V.P.; Pilipenko, V.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. ANTIPROTON REACTIONS/cluster model; CARBON 12 TARGET/antiproton reactions; OXYGEN 16 TARGET/antiproton reactions; DIFFERENTIAL CROSS SECTIONS; ELASTIC SCATTERING; MEV RANGE 100-1000; SPIN ORIENTATION

34372 (INIS-RU–347, pp. 339) **Comparative description pA and p-barA scattering under diffraction scaling conditions.** Berezhnoj, Yu.A. (Khar'kovskij Gosudarstvennyj Univ., Kharkov (Ukraine)); Kudryavtsev, I.N.; Soznik, A.P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. ANTIPROTON REACTIONS/diffraction models; CARBON 12 TARGET/antiproton reactions; CARBON 12 TARGET/proton reactions; DIFFERENTIAL CROSS SECTIONS; S MATRIX; SCALING LAWS

34373 (INIS-RU–347, pp. 340) **Elastic scattering and breakup of weakly coupled particles in adiabatic approximation.** Verbitskij, V.P. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yademykh Issledovanij); Terenetskij, K.O. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. HEAVY ION REACTIONS/adiabatic approximation; HEAVY ION REACTIONS/light ions; BREAKUP REACTIONS; COULOMB FIELD; DIFFERENTIAL CROSS SECTIONS; NEUTRON-RICH ISOTOPES; NUCLEI; TOTAL CROSS SECTIONS

34374 (INIS-RU–347, pp. 342) **On the D+D fusion reaction.** Sokolov, M.V. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij). AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. DEUTERIUM TARGET/deuteron reactions; FINAL-STATE INTERACTIONS; FUSION YIELD; NUCLEAR REACTION KINETICS; PROTONS; THRESHOLD ENERGY; TRITIUM

34375 (INIS-RU–347, pp. 344) **Photodisintegration of ^{16}O nucleus in J matrix method.** Knyr, V.A. (Khabarovskij Politekhnicheskij Inst., Khabarovsk (Russian Federation)); Mazur, A.I.; Smirnov, Yu.F.; Shirokov, A.M. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.
Short communication. 3 refs., 1 fig. OXYGEN 16 TARGET/photonuclear reactions; PHOTONUCLEAR REACTIONS/breakup reactions; CROSS SECTIONS; ENERGY LEVELS; MATRICES; NUCLEAR POTENTIAL; SHELL MODELS

34376 (INIS-RU–347, pp. 347) **Taking corrections for inelastic scattering of deuterons and α-particles on light nuclei at mean energies.** Il'in, I.M. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki). AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 3 refs. CARBON 12 TARGET/alpha reactions; CARBON 12 TARGET/deuteron reactions; OXYGEN 16 TARGET/alpha reactions; OXYGEN 16 TARGET/deuteron reactions; CORRECTIONS; SHELL MODELS; TOTAL CROSS SECTIONS; WOODS-SAXON POTENTIAL

34377 (INIS-RU–347, pp. 352) **Potential description of light nucleus electrodisintegration.** Zhusupov, M.A.; Ibraeva, E.T.; Usmanov, T.G. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 3 refs. BERYLLIUM 9 TARGET/electron reactions; ELECTRON REACTIONS/knock-out reactions; LITHIUM 6 TARGET/electron reactions; ALPHA PARTICLES; CLUSTER MODEL; DEUTERONS; ENERGY SPECTRA; NUCLEONS; POTENTIALS

34378 (INIS-RU–347, pp. 353) **P-odd effects in neutron interactions with ^{117}Sn and ^{139}La nuclei and negative resonance positions.** Barabanov, A.L. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 3 refs. LANTHANUM 139 TARGET/neutron reactions; TIN 117 TARGET/neutron reactions; P STATES; PARITY; POLARIZED BEAMS; SLOW NEUTRONS; TRANSMISSION

34379 (INIS-RU–347, pp. 354) **Dependence of nucleon-nucleus interaction cross section on momentum distribution of nucleons in the nucleus-target.** Galanina, L.I. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Zelenskaya, N.S. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 4 refs. CARBON 12 TARGET/proton reactions; OXYGEN 16 TARGET/proton reactions; PROTON REACTIONS/differential cross sections; DISTRIBUTION FUNCTIONS; GEV RANGE 01-10; NUCLEONS; WAVE FUNCTIONS

34380 (INIS-RU–347, pp. 355) **Spin-isospin response of nucleus in process of the single charge-exchange pion.** Kurepin, A.B.; Topil'skaya, N.S.; Kulagin, S.A.; Al'beriko, V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 2 refs. PION REACTIONS/charge-exchange reactions; ISOSPIN; MEV RANGE 100-1000; NUCLEAR MATTER; PIONS; RANDOM PHASE APPROXIMATION; RESPONSE FUNCTIONS; SPIN

34381 (INIS-RU–347, pp. 356) **Estimation of the (n,n') reaction cross sections on ^{208}Pb nucleus.** Barabanov, A.L.; Kloss, Yu.Yu. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 3 refs. LEAD 208 TARGET/neutron reactions; CROSS SECTIONS; ENERGY DEPENDENCE; EXCITED STATES; INELASTIC SCATTERING; MEV RANGE 01-10; NEUTRONS; NUCLEAR POTENTIAL; OPTICAL MODELS

34382 (INIS-RU–347, pp. 357) **Optical method for calculation of the compound process cross sections.** Ezhov, S.N. (Kievskij Gosudarstvennyj Univ., Kiev (Ukraine)); Plyujko, V.A. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 2 refs. NEUTRON REACTIONS/compound-nucleus reactions; TUNGSTEN 182 TARGET/neutron reactions; TUNGSTEN 184 TARGET/neutron reactions; TUNGSTEN 186 TARGET/neutron reactions; CROSS SECTIONS; ELASTIC SCATTERING; EXCITATION FUNCTIONS; MEV RANGE 01-10; ROTATIONAL STATES

34383 (INIS-RU–347, pp. 358) **Optical potential and t matrix of neutron-nucleus scattering in Hartree-Fock approximation.** Kuprikov, V.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Soznik, A.P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.
Short communication. 3 refs. NEUTRON REACTIONS/nuclear potential; NEUTRON REACTIONS/s matrix; POTASSIUM 40 TARGET/neutron reactions; ELASTIC SCATTERING; HARTREE-FOCK METHOD; MEV RANGE 01-10; MEV RANGE 10-100; OPTICAL MODELS; PHASE SHIFT; SKYRME POTENTIAL

34384 (INIS-RU–347, pp. 359) **Using the real nuclear Hamiltonian for analysis of nucleon scattering by nonaxial deformed even-even nuclei.** Porodzinskij, Yu.V.; Sukhovitskij, E.Sh. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.
Printed by 'Nauka', S.-Petersburg' division.

Short communication. NEUTRON REACTIONS/coupled channel theory; COLLECTIVE MODEL; DEFORMED NUCLEI; EVEN-EVEN NUCLEI; HAMILTONIANS; ROTATIONAL STATES; S MATRIX; SCATTERING; SELENIUM 76 TARGET; URANIUM 238 TARGET

34385 (INIS-RU–347, pp. 360) **Microscopic description of the proton-light nuclei diffraction interaction.** Ismatov, E.I. (AN Uzbekskoj SSR, Tashkent (Uzbekistan). Inst. Yadernoj Fiziki). AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. CARBON 12 TARGET/proton reactions; PROTON REACTIONS/glauber theory; PROTON REACTIONS/knock-out reactions; DIFFERENTIAL CROSS SECTIONS; INELASTIC SCATTERING; L-S COUPLING; MATRIX ELEMENTS; PROTONS; SHELL MODELS

34386 (INIS-RU–347, pp. 361) **Excitation of low-lying states in oriented nuclei with nonzero spin by polarized protons.** Kudryavtsev, I.N. (Khar'kovskij Gosudarstvennyj Univ., Kharkov (Ukraine)); Soznik, A.P. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs., 1 fig. CARBON 13 TARGET/proton reactions; CROSS SECTIONS; EXCITATION; EXCITED STATES; INELASTIC SCATTERING; MEV RANGE 100-1000; ORIENTED NUCLEI; POLARIZED BEAMS; SHELL MODELS; SPIN

34387 (INIS-RU–347, pp. 362) **Theoretical investigation of gamma radiation of excited nuclei in the $\gamma A \rightarrow \pi A^*$ reactions.** Tryasuchev, V.A.; Kolchin, A.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. CARBON 12 TARGET/photonuclear reactions; PHOTONUCLEAR REACTIONS/shell models; ANGULAR DISTRIBUTION; BORON 12; CARBON 12; DIFFERENTIAL CROSS SECTIONS; EXCITED STATES; GAMMA RADIATION; INTERMEDIATE COUPLING; PIONS; POLARIZED PRODUCTS

34388 (INIS-RU–347, pp. 364) **Multi-phonon version of the coupled channel method and cross section analysis of low-energy neutron inelastic scattering by spherical nuclei.** Samojlov, V.V. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Urin, M.G. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 4 refs. NEUTRON REACTIONS/coupled channel theory; NEUTRON REACTIONS/inelastic scattering; NUCLEI/neutron reactions; NUCLEI; PHONONS; SPHERICAL MODEL; TOTAL CROSS SECTIONS; WAVE FUNCTIONS

34389 (INIS-RU–347, pp. 368) **Connection of macroscopic and microscopic approaches to the description of the double nuclear system dynamics.** Adamyan, G.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Antonenko, N.V.; Dzholos, R.V.; Nasirov, A.K. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. ARGON 40 REACTIONS/heavy ion fusion reactions; ARGON 40 REACTIONS/quasi-fission; SULFUR 32 REACTIONS/heavy ion fusion reactions; SULFUR 32 REACTIONS/quasi-fission; THORIUM 232 TARGET/argon 40 reactions; URANIUM 238 TARGET/sulfur 32 reactions; QUASI-FISSION; MASS SPECTRA; MULTI-NUCLEON TRANSFER REACTIONS; NUCLEAR FRAGMENTS; NUCLEAR POTENTIAL; NUCLEAR REACTION KINETICS; NUCLEAR TEMPERATURE

34390 (INIS-RU–347, pp. 369) **Role of quantum fluctuations in decay of double nuclear system.** Antonenko, N.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Dzholos, R.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 2 refs. HEAVY ION REACTIONS/compound nuclei; HEAVY ION REACTIONS/fluctuations; ALPHA PARTICLES; ARGON IONS; CHROMIUM IONS; EQUATIONS OF MOTION; FLUCTUATIONS; NUCLEAR DECAY

34391 (INIS-RU–347, pp. 370) **Shaking-off nucleons with weakly coupled projectile and their rescattering in the nucleus-target field.** Zagrebaev, V.I. (Chuvashskij Gosudarstvennyj Univ., Cheboksary (Russian Federation)). AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 1 ref. LITHIUM 11 REACTIONS/stripping; CROSS SECTIONS; STRIPPING; LITHIUM 9; NEUTRON-RICH ISOTOPES; NEUTRONS; RESCATTERING; TARGETS

34392 (INIS-RU–347, pp. 373) **Analysis of the angular correlation function in the massive transfer reactions in the frame of direct and statistical approaches.** Belyaeva, T.L. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Zelenskaya, N.S.; Odintsov, N.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). (CONF-9204253–: International conference on nuclear spectroscopy and nuclear structure, Alma-Ata (Kazakhstan), 21-24 Apr 1992). In *Nuclear spectroscopy and nuclear structure: Summary of reports for International conference.* 486p. Order Number DE94600001. Source: OSTI; NTIS (US Sales Only); INIS.

Printed by 'Nauka', S.-Petersburg' division.

Short communication. 3 refs. CARBON 12 TARGET/nitrogen 14 reactions; NITROGEN 14 REACTIONS/angular correlation; NITROGEN 14 REACTIONS/incomplete fusion reactions; ALPHA PARTICLES; COMPOUND-NUCLEUS REACTIONS; DEUTERONS; DIFFERENTIAL CROSS SECTIONS; EXCITED STATES; MAGNESIUM 24; MEV RANGE 10-100; STATISTICAL MODELS

34393 (INIS-RU–347, pp. 374) **Study on the A(^{11}LI, ^{9}LI) reaction mechanisms and ^{11}LI nucleus structure.** Vasil'ev, Yu.O. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij);

Evlanov, M.V. AN SSSR, Moscow (Russian Federation); AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki. 1992. (In Russian). 34410 (LBL–34277) **Production and polarization of beta-emitting projectile fragment ^{43}Ti.** Matsuta, K. (Osaka Univ., Toyonaka (Japan). Dept. of Physics); Ozawa, A.; Nojiri, Y. Lawrence Berkeley Lab., CA (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930534–5: 3. international conference on radioactive nuclear beams, East Lansing, MI (United States), 24-27 May 1993). Order Number DE93018529. Source: OSTI; NTIS; INIS; GPO Dep.

The projectile fragmentation of ^{46}Ti on Au and C targets has been studied at 116A MeV. For one of the fragment nuclei, ^{43}Ti, production cross sections, longitudinal momentum distributions, angular distributions, and fragment polarization were observed. The observed angular distribution and the spin polarization of ^{43}Ti for the C target suggested negative angle deflection of the nuclei due to the nuclear attractive potential. The magnetic moment of ^{43}Ti

was determined by means of β-NMR technique as $|\mu| = (0.85 \pm 0.02)\ \mu_N$.

34411 (UCRL-JC–113180) **Calculation of nuclear data for incident energies to 200 MeV with the FKK-GNASH code system.** Chadwick, M.B. (Lawrence Livermore National Lab., CA (United States)); Young, P.G. Lawrence Livermore National Lab., CA (United States). Feb 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930168–7: Simulating accelerator radiation environments workshop, Santa Fe, NM (United States), 11-15 Jan 1993). Order Number DE93018089. Source: OSTI; NTIS; INIS; GPO Dep.

We describe how the FKK-GNASH code system has been extended to calculate nucleon-induced reactions up to 200 MeV, and used to predict (p,xn) and (p,xp) cross sections on ^{208}Pb at incident energies of 25, 45, 80 and 160 MeV, for an intermediate energy code intercomparison. Details of the reaction mechanisms calculated by FKK-GNASH are given, and the calculational procedure is described.

34412 (UCRL-JC–113668) **Radiative capture mechanisms in the ^{89}Y($\vec{p}$,γ) reaction.** Parker, W.E. (Lawrence Livermore National Lab., CA (United States)); Dietrich, F.S.; Sale, K.E.; Kammeraad, J.E.; Luke, S.J.; Weller, H.R.; Chasteler, R.M.; Godwin, M.A.; Kramer, L.; Schmid, G.J. Lawrence Livermore National Lab., CA (United States). 28 Jul 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;FG05-91ER40619. (CONF-9309173–3: Capture gamma-ray symposium, Fribourg (Switzerland), 20-24 Sep 1993). Order Number DE93018629. Source: OSTI; NTIS; INIS; GPO Dep.

We have measured the spectra of gamma rays from approximately 14 MeV to the endpoint in the ^{89}Y($\vec{p}$,γ) reaction with 19.6 MeV polarized protons from the TUNL tandem accelerator. Gamma spectra were measured with a pair of 25.4 cm × 25.4 cm anticoincidence shielded NaI detectors at angles of 30, 55, 90, 125, and 150° with respect to the incident beam. The γ-ray spectra show significant analyzing powers and forward peaking of the angular distributions. These features allow for the discrimination between compound processes which do not exhibit interference between different channels, and direct processes. The observed interference effects indicate that multistep-direct processes are important at γ-ray energies lower than those for which direct-semidirect capture is the dominant mechanism.

34413 (ANL/ER/CP–79720) **Basic physical and chemical information needed for development of Monte Carlo codes.** Inokuti, M. Argonne National Lab., IL (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9304185–1: DOE workshop on computational approaches in molecular radiation biology: Monte Carlo methods, Irvine, CA (United States), 26-29 Apr 1993). Order Number DE93018571. Source: OSTI; NTIS; INIS; GPO Dep.

It is important to view track structure analysis as an application of a branch of theoretical physics (i.e., statistical physics and physical kinetics in the language of the Landau school). Monte Carlo methods and transport equation methods represent two major approaches. In either approach, it is of paramount importance to use as input the cross section data that best represent the elementary microscopic processes. Transport analysis based on unrealistic input data must be viewed with caution, because results can be misleading. Work toward establishing the cross section data, which demands a wide scope of knowledge and expertise, is being carried out through extensive international collaborations. In track structure analysis for radiation biology, the need for cross sections for the interactions of electrons with DNA and neighboring protein molecules seems to be especially urgent. Finally, it is important to interpret results of Monte Carlo calculations fully and adequately. To this end, workers should document input data as thoroughly as possible and report their results in detail in many ways. Workers in analytic transport theory are then likely to contribute to the interpretation of the results.

34414 (CNIC–00530, pp. 42-47) **Progress on neutron data evaluation activities in Lanzhou University.** Yao Lishan (Institute of Nuclear Research, Lanzhou Univ. (China)). Chinese Nuclear Data Center, Beijing, BJ (China); China Nuclear Information Centre, Beijing, BJ (China). Jun 1991. (CNDC–0006;INDC(CPR)–022/L.). In *Communication of nuclear data progress: No.5 (1991).* 77p. Order Number DE93633161. Source: OSTI; NTIS (US Sales Only); INIS.

Lanzhou University is one of the earliest units which joined the Chinese Nuclear Data coordination Network. The evaluation of neutron nuclear data, the theoretical calculation for neutron data and the systematics of neutron reaction cross section in Lanzhou University is introduced. The evaluations of Ti, Sn, Sb, ^{181}Ta have been completed respectively. The systematic study for (n, 2n), (n, 3n) and (n, x) (x = p, t, ^{3}He, d, α) reaction cross sections have been performed. The evaluations and theoretical calculations of neutron resonance parameters, γ production data and the double differential neutron emitted cross sections are performed.

This is the seventh issue of communication of Nuclear Data Progress (CNDP), in which the nuclear data progress in china during the last year is presented. It includes 14 MeV neutron activation cross section nuclear decay data inelastic angular distribution integral prompt spontaneous fission neutron spectrum and α spectrum measurements of reaction ^{40}Ca(n, α); programs UNF-for fast neutron data calculation of structural materials, APCOM and APOM for searching optimal charged particle and neutron optical potential parameters respectively; P + ^{63}Cu reaction calculation in energy region 3 ≈ 55 MeV; evaluation of ^{197}Au (n, Zn) ^{196}Au cross section, progress on nuclear structure and decay data evaluation for A-chain a database on ion-atom collision processes, and evaluation of trapping and desorption data, systematics calculation of nuclear data for radiation damage assessment and related safety aspects, and systematics of (n, t) and (n, ^{3}He) reaction cross sections at 14 MeV, construction of covariance matrix for experimental data, Spline fit for multi-sets of correlative data etc.

34416 (CTH-RF–94) **Exact solution of some one-speed neutron transport problems.** Sjoestrand, N.G. Chalmers Univ. of Technology, Goeteborg (Sweden). Dept. of Reactor Physics. Dec 1992. 18p. Order Number DE94600425. Source: OSTI; NTIS; INIS.

An analytical solution has earlier been obtained to the one-speed neutron transport equation for infinite slabs with reflection coefficient +1 or -1 on both sides. The solution is now extended to an

arbitrary number of terms in the scattering function. It is shown that some problems with strongly forward and backward scattering can also be solved exactly. Further, the corresponding problem for a sphere and with time dependence is discussed. (16 refs.).

34417 (DOE/FTR–93015636) **Travel to Italy to attend conference on small-angle x-ray and neutron scattering: Foreign trip report, May 9–20, 1993.** Schaefer, D.W. Sandia National Labs., Albuquerque, NM (United States). 8 Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015636. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The NATO Advanced Study Institute on Advanced Topics in Small Angle Scattering was designed to expose young scientists from NATO countries to recent advances through lectures presented by leading experts from around the world. Although participants are primarily from NATO countries, NATO policy now encourages participation by scientists from former Soviet block countries. Dr. Schaefer presented a lecture on application of small-angle neutron scattering to the study of porous ceramic materials. In addition he offended lecture and workshops presented by other scientists. The highlight of the conference was a brief presentation by the aging Dr. Andre Guinier, the inventor of the small-angle scattering technique. Guinier described his experience 50 years ago when he first observed and explained x-ray scattering at very small angles.

34421 (KFKI–1992-28/B,G) **Killing symmetries in neutron transport.** Lukacs, B.; Racz, A. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Oct 1992. 20p. Order Number DE94600426. Source: OSTI; NTIS (US Sales Only); INIS.

Although inside the reactor zone there is no exact continuous spatial symmetry, in certain configurations neutron flux distribution is close to a symmetrical one. In such cases the symmetrical solution could provide a good starting point to determine the non-symmetrical power distribution. All possible symmetries are determined in the 3-dimensional Euclidean space, and the form of the transport equation is discussed in such a coordinate system which is adapted to the particular symmetry. Possible spontaneous symmetry breakings are pointed out. (author) 6 refs.

34422 (KFKI–1992-30/A) **To the problem of the coherence length of neutrons.** Varga, P. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Nov 1992. 16p. Order Number DE94600427. Source: OSTI; NTIS (US Sales Only); INIS.

The challenge of the high accuracy of certain optical measurements, the long coherence length of light provokes one to search for possibilities to enlarge the neutron coherence length. A proposal is made to achieve this by using a five or a four plate Bonse-Hart interferometer. A further problem is, whether the neutron beam is composed of wave packets or of overlapping independent monochromatic waves; it is considered that the former is more likely. (author) 12 refs.; 3 figs.

34423 (LA-UR–93-2300) **Improved approximations applied to the S_N even-parity equation.** Noh, Taewan, Miller, W.F. Jr.; Morel, J.E. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-931160–5: American Nuclear Society (ANS) winter meeting, San Francisco, CA (United States), 14-19 Nov 1993). Order Number DE93016467. Source: OSTI; NTIS; GPO Dep.

We have developed various finite element differencing schemes by applying lumping techniques in neutron streaming and removal terms of the S_N even-parity transport equation in two-dimensional x-y geometry. We have derived an analytical form of the even-parity reflective boundary condition, which along with the vacuum boundary condition can be applied directly to solve second-order even-parity boundary value problems. We have also developed a new simplified even-parity equation that is much more computationally efficient than the even-parity equation. The developed schemes are numerically compared with the conventional first-order diamond-differencing (DD) scheme.

34424 (LA-UR–93-2301) **Asymptotic derivation of the modified time-dependent SP_2 equations and numerical calculations.** Shin, Uncheol; Miller, W.F. Jr.; Morel, J.E. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-931160–6: American Nuclear Society (ANS) winter meeting, San Francisco, CA (United States), 14-19 Nov 1993). Order Number DE93016466. Source: OSTI; NTIS; GPO Dep.

Converting the independent variables of the transport equation to dimensionless parameters, asymptotic analyses can be performed to show that, for an important class of problems, the diffusion equation is an asymptotic limit of the transport equation. A recent paper by Larsen, McGhee, and Morel provides a broadened view of the result discussed above. It deals with the steady-state transport equation and shows that the Simplified Spherical-Harmonics (SP_N) equations are robust high-order asymptotic approximations of the transport equation in a physical regime in which the conventional diffusion equation is the leading-order approximation. According to the reported numerical results for the steady-state cases, for many problems, low-order SP_N equations capture most of the transport corrections to the diffusion approximation. And Larsen shows that, in nearly all cases, the SP_2 results are significantly more accurate than diffusion results in the steady-state problems.

34425 (LA-UR–93-2429) **LAHET calculations for accelerator neutron production.** Prael, R.E. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington,

DC (United States). DOE Contract W-7405-ENG-36. (CONF-931160–4: American Nuclear Society (ANS) winter meeting, San Francisco, CA (United States), 14-19 Nov 1993). Order Number DE93016518. Source: OSTI; NTIS; INIS; GPO Dep.

LAHET is a Monte Carlo code for the transport and interaction of nucleons, pions, muons, fight ions, and antinucleons in complex geometry; it is the result of a major effort at Los Alamos National Laboratory to develop a code system based on the LANL version of the HETC Monte Carlo code for the transport of nucleons, pions, and muons, which was originally developed at Oak Ridge National Laboratory. The system of codes based on LAHET is designated as the LAHET Code System (LCS). LAHET, as all the variants of HETC, has been widely used over the years for design of neutron production targets, facility shielding, and experimental analysis. LAHET is now widely used for medical accelerator facility design and application. Particle tracking uses the general geometry model of the LANL MCNP code, and shares the geometry description and input of MCNP, except for lattices and/or repeated structures. HMCNP is a modification of MCNP which accepts an. external neutron/photon source created by LAHET. Neutron transport from 20 MeV to thermal and all photon/electron transport is done with HMCNP.

34426 (LA-UR–93-2582) **Comparison of energy deposition calculations by the LAHET Code System with experimental results.** Beard, C.A.; Lisowski, P.W.; Russell, G.J.; Waters, L.S. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930913–15: Global '93: future nuclear systems - emerging fuel cycles and waste disposal options, Seattle, WA (United States), 12-17 Sep 1993). Order Number DE93018549. Source: OSTI; NTIS; INIS; GPO Dep.

A comparison was performed between the energy deposition predicted by the LAHET Code System (LCS) with experimental values determined by Belyakov-Bodin et al. for 800, 1000, and 1200 MeV protons on targets composed of lead, bismuth, beryllium, carbon, and aluminum. The lead and bismuth showed agreement within approximately 10% at locations throughout the targets, and the agreement of the total energy deposited over the axial length of the targets ranged from 1% to 25%. For the lead and bismuth cases, the LCS predictions were always greater than the experimental results. For the lighter materials, the agreement at locations throughout the target only agreed within approximately 20%. No definable trend could be determined for the lighter materials since some LCS predictions were greater than the experimental results, some were less than the experimental results, and some showed very good agreement. The total energy deposited over the axial length of the targets was not compared for the lighter materials since it was not explicitly given with the experimental data.

34427 (ORNL/FTR–4602) **Travel to France to attend seminar on advanced Monte Carlo Computer Program for Radiation Transport: Foreign trip report, April 25–May 2, 1993.** Johnson, J.O. Oak Ridge National Lab., TN (United States). 11 May 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014360. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the Organization for Economic Cooperation and Development (OECD) Nuclear Energy Agency (NEA) Seminar on Advanced Monte Carlo Computer Programs for Radiation Transport at Centre d'Etudes, Saclay, France, to present an invited paper on the recent developments and status of the Monte Carlo Adjoint Shielding Code System, MASH 1.0. The traveler also exchanged information in the use of Monte Carlo techniques with other attendees in the hope of gathering new ideas and developments for implementation into the next version of MASH to keep the ORNL MASH Code System a "state-of- the-art" computational tool for shielding design and analysis.

34428 (ORNL/FTR–4604) **Travel to France to participate in seminar on Advanced Monte Carlo Programs for Radiation Transport: Foreign trip report, April 24–May 1, 1993.** Tang, J.S. Oak Ridge National Lab., TN (United States). 17 May 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014638. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the Seminar on Advanced Monte Carlo Programs for Radiation Transport, April 27–29, 1993, Centre d'Etudes, Saclay, France. The seminar was attended by about 100 persons from 20 countries. A total of 59 papers were presented. A wide range of topics relating to Monte Carlo solutions to radiation shielding problems were presented. Discussions included major Monte Carlo computer programs from the United States, France, and the United Kingdom, new developments in automatic biasing techniques for variance reduction, application of vector and parallel computer architectures to Monte Carlo, and user experience and applications of the Monte Carlo method in solving various problems. The majority of the papers concerned neutron and photon transport; fewer than ten papers were related to coupled electron/photon transport and other topics. The traveler presented an invited paper entitled "Development and Application of the Automated Monte Carlo Biasing Procedure in SAS4." The talk was well received, and much feedback and discussions were generated. The traveler benefits a great deal from the standpoint of technical and professional development as a result of personal interaction and many fruitful discussions with other experts on the Monte Carlo method. Possibly some of the new ideas and innovations may be used to improve the US Department of Energy role in developing additional methods to be used in transportation

The time and concentration dependences of the disordered static transfer of the donor excitation energy at the elementary interaction of the donor with two ions of the acceptor, were investigated in the $Y_3Al_5O_{12}$ and $YAlO_3$ crystals. The measurements were made at 300 K and the Er^{3+} concentrations of 0.5-15%. The crystals were excited by the second harmonics of the YAG-Nd^{3+} laser. Basing on the analysis of the results obtained the conclusion is made that the interaction between Er^{3+} ions has the dipole-dipole character. It does not change with activator ion concentration increase. The data on the luminescence time and concentration dependences may be described theoretically using the approximation of black spheres.

34435 (UCRL-JC–112950) **Absorption and x-ray measurements from ultra-intense laser-plasma interactions.** Klem, D.E.; Darrow, C.; Lane, S.; Perry, M.D. Lawrence Livermore National Lab., CA (United States). 1 Mar 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–50: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93016538. Source: OSTI; NTIS; GPO Dep.

The interaction of subpicosecond 1.06 mm laser light at intensities up to 10^{18} W/cm^2 with dense performed plasmas is investigated by measurements of the absorption of the laser light in the plasma and by measurements of the production of bremsstrahlung x-rays. Absorption measurements are made by collecting the scattered light in an Ulbricht sphere. Light scattered in the backward and specular directions is collected separately. Measurements are presented for both high and low Z targets. X-ray production is measured using a nine channel filter/scintillator spectrometer.

34436 (UCRL-JC–113498) **Analysis of neon soft x-ray spectra from short-pulse laser-produced plasmas.** Abare, A.C. (Florida Univ., Gainesville, FL (United States)); Keane, C.J.; Crane, J.K.; DaSilva, L.B.; Lee, R.W.; Perry, M.D.; Falcone, R.W. Lawrence Livermore National Lab., CA (United States). Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–36: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93014420. Source: OSTI; NTIS; INIS; GPO Dep.

We report preliminary results from the analysis of streaked soft x-ray neon spectra obtained from the interaction of a picosecond Nd:glass laser with a gas jet target. In these experiments streaked spectra show prompt harmonic emission followed by longer time duration soft x-ray line emission. The majority of the line emission observed was found to originate from Li- and Be-like Ne and the major transitions in the observed spectra have been identified. Li-like emission lines were observed to decay faster in time than Be-like transitions, suggesting that recombination is taking place. Line ratios of n=4-2 and n=3-2 transitions supported the view that these lines were optically thin and thick, respectively. The time history of Li-like Ne 2p-4d and 2p-3d lines is in good agreement with a simple adiabatic expansion model coupled to a time dependent collisional-radiative code. Further x-ray spectroscopic analysis is underway which is aimed at diagnosing plasma conditions and assessing the potential of this recombining neon plasma as a quasi-steady-state recombination x-ray laser medium.

34437 (UCRL-JC–113605) **Modelling of intense line radiation from laser-produced plasmas.** Lee, Yim T.; Gee, M. Lawrence Livermore National Lab., CA (United States). Apr 1990. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-891136–3: 9. international workshop on laser interaction and related plasma phenomena, Monterey, CA (United States), 6-10 Nov 1989). Order Number DE93018636. Source: OSTI; NTIS; GPO Dep.

In this paper, we discuss modelling of Lyman-α (i.e. Ly-α) radiation emitted from laser-produced plasmas. We are interested in the application of one of these line radiations to pump a transition of an ion in a different plasma spatially separated from the emitting source. The interest is in perturbing the plasma rather than just probing it as in some backlighting experiments. As a result of pumping, the populations of certain excited levels are inverted. The resulting gain coefficients depend strongly on the population inversion density which in turn depends on the brightness of the pump radiation. As a result, we must produce an intense bright radiation source. In addition, to pump a transition effectively, we also need a pump line with a width larger than the mismatch of the resonance since the widths of the pumped transitions are rather narrow.

34438 (CONF-920948–14) **Search for resonant electron transfer and double excitation in Kr^{34+} + H_2 collisions.** Zaharakis, K.E. (Western Michigan Univ., Kalamazoo, MI (United States)); Haar, R.R.; Tanis, J.A.; Clark, M.W.; Plano, V.L. Western Michigan Univ., Kalamazoo, MI (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13778. From 6. international conference on physics of highly charged ions; Manhattan, KS (United States); 28 Sep - 2 oct 1992. Order Number DE93018776. Source: OSTI; NTIS; INIS; GPO Dep.

Resonant electron transfer and double excitation (RME) is a correlated electron process which is expected to occur in an ion-atom collision when electron capture is accompanied by the simultaneous excitation of two inner-shell electrons. RT2 is similar to resonant transfer excitation (RTE) in which only a single electron is excited. RT2E was investigated experimentally for 38–42 MeV/u Kr^{34} + H_2 collisions by observing x-ray emission associated with single-electron capture. No events associated with Kr K x rays

(near 13 keV were observed; however, events do occur at about twice (> 22 keV) the Kr K x-ray energy. Several possible sources of these latter x rays have been considered.

DOE Contract FG02-87ER13778. Grant 3011;Grant 0130/88. From 6. international conference on physics of highly charged ions; Manhattan, KS (United States); 28 Sep - 2 oct 1992. Order Number DE93018778. Source: OSTI; NTIS; INIS; GPO Dep.

Cusp-electron production has been investigated in collisions of 75–300 keV He^+ with Ar. The relative contributions from electron capture to the continuum (ECC), transfer ionization (TI), and electron loss to the continuum (ELC) to the total cusp electron production were measured. Over the energy range investigated, ECC was found to decrease from about 86% to 80%, TI decreased from about 12% to 1%, and ELC increased from about 2% to 20%. The present results are consistent with earlier work for He^+ and O^{q+} projectiles.

34440 (DOE/ER/13519–7) **Experimental study of interactions of highly charged ions with atoms at keV energies: Progress report, August 15, 1990–February 15, 1993.** Kostroun, V.O. Cornell Univ., Ithaca, NY (United States). 29 Jan 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13519. Order Number DE93040222. Source: OSTI; NTIS; GPO Dep.

This final progress report summarizes the work carried out during the 29 month period from August 15, 1990 to February 15, 1993 under grant DE-FG02-86ER13519. The following experiments were done. We measured the absolute total and one- and two-electron transfer cross sections for Ar^{q+} ($8 \leq q \leq 16$) on He and H_2 at 2.3 qkeV, the angular distributions of the scattered projectiles in $Ar^{8+,9+}$ collisions, with Ar and Kr at 2.3 qkeV, the electron emissions in low energy Ar^{q+} on Ar collisions, the recoil ion charge state distributions in low energy Ar^{q+} -Ar collisions, the absolute total and one-and two-electron transfer cross sections for Ar^{8+} on Ar at 2.3 qkeV, and the absolute total and one- and two-electron transfer cross sections for Ar^{8+} on Ar as a function of energy. We also used energy gain spectroscopy to study Ar^{q+} on Ar collisions at 40 and 30 qeV, and time of flight spectroscopy to investigate ionization and dissociation of CO and N_2 in collisions with low energy, highly charged argon ions. In addition, we applied the Goldberger and Watson transition theory to derive transition rates and cross sections for atomic radiative and/or non radiative processes, wrote a computer code TRANSIT which can calculate energies, wave functions and radiative and non radiative rates for atoms and ions. The code is highly modular and can easily be modified to calculate higher order processes. Finally, we have done an Ab-Initio molecular orbital electronic energy level calculation for the $(ArAr)^{8+}$ system as a function internuclear separation.

34441 (DOE/ER/13778–6) **Correlated charge-changing ion-atom collisions: Progress report, February 16, 1990–February 15, 1993.** Tanis, J.A. Western Michigan Univ., Kalamazoo, MI (United States). Feb 1993. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13778. Order Number DE93018717. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the progress and accomplishments in accelerator atomic physics research supported by DOE grant DE-FG02-87ER13778 from February 16, 1990 through February 15, 1993. This work involves the experimental investigation of atomic interactions in collisions of charged projectiles with neutral targets or electrons, with particular emphasis on two-electron interactions and electron-correlation effects. The processes studied are of interest both from fundamental and applied points of view. In the latter case, results are obtained which are relevant to the understanding of laboratory and astrophysical plasmas, highly-excited (Rydberg) and continuum states of atoms and ions, atomic structure effects, the interaction of ions with surfaces, and the development of heavy-ion storage-rings. The results obtained have provided the basis for several M.A. thesis projects at Western Michigan and several Ph.D. dissertation projects are currently underway. Summaries of work completed and work in progress are given below in Section II. This research has resulted in 26 papers (in print and in press), 12 invited presentations at national and international meetings, and 28 contributed presentations as detailed in Section III.

34442 (LA-UR–93-2486) **Electron impact polarization and correlation properties of the inert gases.** Csanak, G. (Los Alamos National Lab., NM (United States)); Cartwright, D.C.; Machado, L.E.; Meneses, G.D. Los Alamos National Lab., NM (United States). [1993]. 29p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9307116–1: Polarization and correlation in electronic and atomic collisions, Bielefeld (Germany), 29-31 Jul 1993). Order Number DE93018358. Source: OSTI; NTIS; INIS; GPO Dep.

For the heavier rare-gas targets, Ne, Ar, Kr, there is now a reasonable amount of experimental electron impact coherence parameter data available for excitation of the lowest J = 1 states. Theoretical results for those rare-gas targets have been restricted to distorted-wave approximation (DWA) type theories. A systemization of the experimental data is presented, and they are compared with available theoretical results. In the case of the heavy rare gases, the experimental and theoretical data available for the three species, Ne, Ar, Kr, are compared in order to identify trends. The experimental data are compared with results from available theories (mainly DWA type), and the importance of spin-orbit coupling effects and "shell" effects is discussed. A physical picture that is emerging from all collisional data is presented, and future experimental and theoretical activities that will, provide new insight into the physics of these processes are recommended.

34443 (UCRL-CR–113452) **Electron impact excitation of copper atoms: Final report.** Stumpf, B.J. (Idaho Univ., Moscow, ID (United States). Dept. of Physics). Lawrence Livermore National Lab., CA (United States); Idaho Univ., Moscow, ID (United States). Dept. of Physics. [1993]. 13p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract B160479;Grant RII - 8902065. Order Number DE93017995. Source: OSTI; NTIS; INIS; GPO Dep.

The optical excitation function method has been used in a crossed atom and electron beam arrangement to measure the electron impact cross section of the copper $4^2P \rightarrow 4^2S$ resonance lines (324.8, 327.4 nm) from threshold (3.8 eV) to 8 eV. Relative experimental cross section data are normalized at an energy of 1000 eV with respect to first Born theory that includes the $4^2S \rightarrow 4^2P$ resonance transition with an oscillator strength of 0.652 and cascading from the $(3d^{10}nd)^2D$ states with n = 4, $\cdots$10. The measured Cu $4^2S^4 \rightarrow 4^2P$ cross section is compared with recent theoretical calculations in close-coupling approximation. Very good agreement is found with the ten-state close-coupling theory of Scheibner.

Livermore National Lab., CA (United States). Jun 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208188–2: North Atlantic Treaty Organization/Advanced Studies Institute (NATO/ASI) summer school: from statistical physics to statistical inference and back, Cargese (France), 31 Aug - 12 sep 1992). Order Number DE93018632. Source: OSTI; NTIS; GPO Dep.

Atomic electrons subject to intense laser fields can absorb many photons, leading either to multiphoton ionization or the emission of a single, energetic photon which can be a high multiple of the laser frequency. The latter process, high-order harmonic generation, has been observed experimentally using a range of laser wavelengths and intensities over the past several years. Harmonic generation spectra have a generic form: a steep decline for the low order harmonics, followed by a plateau extending to high harmonic order, and finally an abrupt cutoff beyond which no harmonics are discernible. During the plateau the harmonic production is a very weak function of the process order. Harmonic generation is a promising source of coherent, tunable radiation in the XUV to soft X-ray range which could have a variety of scientific and possibly technological applications. Its conversion from an interesting multiphoton phenomenon to a useful laboratory radiation source requires a complete understanding of both its microscopic and macroscopic aspects. We present some recent results on the response of single atoms at intensities relevant to the short pulse experiments. The calculations employ time-dependent methods, which we briefly review in the next section. Following that we discuss the behavior of the harmonics as a function of laser intensity. Two features are notable: the slow scaling of the harmonic intensities with laser intensity, and the rapid variation in the phase of the individual harmonics with respect to harmonic order. We then give a simple empirical formula that predicts the extent of the plateau for a given ionization potential, wavelength and intensity.

34446 (UCRL-JC–114575) **Electrical conductivity of hydrogen shocked to megabar pressures.** Weir, S.T.; Nellis, W.J.; Mitchell, A.C. Lawrence Livermore National Lab., CA (United States). Aug 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930676–46: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93019632. Source: OSTI; NTIS; INIS; GPO Dep.

The properties of ultra-high pressure hydrogen have been the subject of much experimental and theoretical study. Of particular interest is the pressure-induced insulator-to-metal transition of hydrogen which, according to recent theoretical calculations, is predicted to occur by band-overlap in the pressure range of 1.5-3.0 Mbars on the zero temperature isotherm. Extremely high pressures are required for metallization since the low-pressure band gap is about 15 eV. Recent static-pressure diamond anvil cell experiments have searched for evidence of an insulator-to-metal transition, but no conclusive evidence for such a transition has yet been supplied. Providing conclusive evidence for hydrogen metallization is difficult because no technique has yet been developed for performing static high-pressure electrical conductivity experiments at megabar pressures. The authors report here on electrical conductivity experiments performed on H_2 and D_2 multi-shocked to megabar pressures. Electrical conductivities of dense fluid hydrogen at these pressures and temperatures reached are needed for calculations of the magnetic fields of Jupiter and Saturn, the magnetic fields being generated by convective dynamos of hot, dense, semiconducting fluid hydrogen. Also, since electrical conduction at the pressure-temperature conditions being studied is due to the thermal excitation of charge carriers across the electronic band gap, these experiments yield valuable information on the width of the band gap at high densities.

6645 Special Atoms and Molecules

34447 (DOE/NV/10872–T61) **Studies of clusters: Fourth quarterly technical progress report, April 1, 1993–June 30, 1993.** Farley, J.W. Nevada Univ., Las Vegas, NV (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE93018961. Source: OSTI; NTIS; GPO Dep.

Positive cluster ions were produced, and the mass spectrum was measured using a radiofrequency quadrupole mass spectrometer. Mass spectra are attached, showing the cluster ions produced using pure ammonia. They have the general formula $(NH_3)_nH_m^+$, where n and m are integers. Peaks with different numbers of hydrogens can barely be resolved. This shows that the ion source can produce cluster ions. The development of sensitive laser techniques is necessary for probing the clusters. During this quarter, we succeeded in using a weak diode laser was used to probe a bean of negative molecular ion. The work on the visible absorption spectrum of D_2O^+ continues, and is now in the analysis phase. The work on the infrared vibrational – rotational spectrum of $H^{15}NO^-$ continues. In the second ion beam machine, a complete reworking of the voltages has been completed, and is being reassembled.

34453 (ANL/MSD/CP–79602) **Phenomenological explanation of elastic anomalies in superlattices.** Grimsditch, M. (Argonne National Lab., IL (United States)); Fullerton, E.E.; Schuller, I.K. Argonne National Lab., IL (United States). Jun 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930405–32: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93017475. Source: OSTI; NTIS; GPO Dep.

The experimental fact that measured elastic and structural properties of superlattices are strongly correlated can be understood on the basis of a simple model based on the packing of hard spheres. The model is consistent with features of many models that have been proposed to explain the supermodulus effect; but contrary to previous explanations, it allows predictions for a given pair of constitutents to be made. For an arbitrary pair of elements, it predicts the existence or non-existence of an elastic anomaly, and a rough estimate of its magnitude.

34454 (BUP–1992-04) **Nucleation of relativistic first-order phase transitions.** Csernai, L.P. (Bergen Univ., Dept. of Physics (Norway)); Kapusta, J.I. Bergen Univ. (Norway). Dept. of Physics. 1992. 36p. Order Number DE94600533. Source: OSTI; NTIS; INIS.

The authors apply the general formalism of Langer to compute the nucleation rate for systems of relativistic particles with zero or small baryon number density and which undergo first-order phase transitions. In particular, the pre-exponential factor is computed and it is proportional to the viscosity. The initial growth rate of a critical size bubble or droplet is limited by the ability of dissipative processes to transport latent heat away from the surface. 30 refs., 4 figs.

34455 (CONF-9302137–1) **Study of ±J Ising spin glasses via multicanonical ensemble.** Celik, T. (Florida State Univ., Tallahassee, FL (US). Supercomputer Computations Research Inst.); Hansmann, U.H.E.; Berg, B. Florida State Univ., Tallahassee, FL (United States). Supercomputer Computations Research Inst. Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States); Deutsche Forschungsgemeinschaft, Bonn (Germany); TUBITAK (Turkey). DOE Contract FG05-87ER40319 ;FC05-85ER25000. (FSU-SCRI–93-31). From 6. annual workshop on recent developments in computer simulation studies in condensed matter physics; Athens, GA (United States); 22-26 Feb 1993. Order Number DE93018269. Source: OSTI; NTIS; INIS; GPO Dep.

The authors performed numerical simulations of 2D and 3D Edwards-Anderson spin glass models by using the recently developed multicanonical ensemble. The ergodicity times increase with the lattice size approximately as V^3. The energy, entropy and other physical quantities are easily calculable at all temperatures from a single simulation. Their finite size scalings and the zero temperature limits are also explored.

34456 (LA-UR–93-2692) **High pressure metallization of Mott Insulators: Magnetic, structural and electronic properties.** Pasternak, M.P. (Tel Aviv Univ. (Israel)); Hearne, G.; Sterer, E.; Taylor, R.D.; Jeanloz, R. Los Alamos National Lab., NM (United States). 20 Jul 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930676–30: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93018295. Source: OSTI; NTIS; INIS; GPO Dep.

High pressure studies of the insulator-metal transition in the $(TM)I_2$ (TM = V, Fe, Co and Ni) compounds are described. Those divalent transition-metal iodides are structurally isomorphous and classified as Mott Insulators. Resistivity, X-ray diffraction and Moessbauer Spectroscopy were employed to investigate the electronic, structural, and magnetic properties as a function of pressure both on the highly correlated and on the metallic regimes.

34457 (SAND–93-1395C) **A mixture model for shock compression of porous multi-component reactive materials.** Baer, M.R. Sandia National Labs., Albuquerque, NM (United States). 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930676–9: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93017638. Source: OSTI; NTIS; INIS; GPO Dep.

A multiphase mixture model is presented to describe shock compression of highly porous, multi-component powders. Volume fractions are represented as independent kinematic variables and thermodynamically-admissible phase interaction constitutive models are formulated in the context of a three phase system. Numerical solutions of the multiphase flow equations simulated impact on a porous layer of mixed powders of Al and Fe_2O_3. The multiphase model predicts dispersive compaction waves which have features similar to observed time-resolved pressure measurements.

34458 (BNL–70343) **Trip to France for a Workshop on Fluorescence Microprobe Beamline at the ESRF: Foreign trip report, April 3–10, 1993.** Jones, K.W. Brookhaven National Lab., Upton, NY (United States). 6 May 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93014797. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A Workshop on Fluorescence Microprobe Beamline at ESRF was held to discuss design considerations for the beam line. Topics considered included descriptions of approaches taken at existing facilities, characteristics of insertion devices, monochromators and focussing instrumentation, fluorescence detection, and layout of the beam line. A detailed proposal for the beam line based on the Workshop discussions will be prepared and submitted to the ESRF Scientific Advisory Committee and ESRF administration for final approval. A start date of 1995 was estimated for installation at the ESRF ring.

34459 (CONF-9304183–1) **Diffraction tomographic signal processing algorithms for tunnel detection.** Witten, A.J. Oak Ridge National Lab., TN (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. tunnel detection symposium; Golden, CO (United States); 26-29 Apr 1993. Order Number DE93018455. Source: OSTI; NTIS; GPO Dep.

Signal processing algorithms have been developed for wave based imaging using diffraction tomography. The basis for this image reconstruction procedure is the generalized projection slice theorem (GPST) which, for homogeneous waves, is an analytic relationship between the spatial Fourier transform of the acquired data and the spatial Fourier transform of the spatial profile (object function) of the object being imaged. Imaging within geophysical

diffraction tomography when only homogeneous waves are considered can then be accomplished by inversion of the GPST using standard numerical techniques. In an attenuating background medium or when eddy currents or static fields are considered, a generalized GPST can be derived that involves both real and complex spatial frequencies. In this case, direct Fourier inversion is not possible because of the presence of the complex frequencies. Although direct inversion and, hence, complete imaging is not possible for such cases, the generalized CPST'S can be used to analytically shift the location of data templates matched to specified targets and these templates can, in turn, be correlated with acquired data to detect and estimate the location of the specified targets. Since GPST's are used directly in the detection problem, there is no need to numerically invert the intergal transform of the object function. For this reason, target detection can be accomplished in a computationally efficient manner independent of the type of measurement or background geologic conditions. A number of GPST's are derived and the use of GPST's for both imaging and detection of subsurface voids is demonstrated in several recent applications.

34460 (DOE/ER/45199–3) **[Gamma scattering in condensed matter with high intensity Moessbauer radiation]: Progress report.** Purdue Univ., Lafayette, IN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER45199. Order Number DE93019461. Source: OSTI; NTIS; INIS; GPO Dep.

The first Moessbauer studies of diffusion in liquid state was carried out using ^{183}Ta ME sources. Liquids studied included pentadecane, polydimethylsiloxane in benzene, and glycercol. Recoilless fractions and Debye-Waller factors were measured. Because of the results of Schecter, we remeasured the ME for dilute tin in lead; no no anomalous cutoff was found in the Debye-Waller factor over 4-300 K, and there was a large broadening in the linewidth for 1.6 at.% (50% at 4.5 K). Advances in ME method are described.

Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-87ER45324. Order Number DE93018307. Source: OSTI; NTIS; GPO Dep.

Over the past year we have finished some projects as anticipated in our recent three year proposal, and we have started some new projects, some of which were not anticipated in our proposal. I will describe briefly our status with regard to students first. Then I will report on the current equipment situation in our UCSC labs. The projects completed or very close to being completed will be described. Projects which we are currently pursuing will be described next. Finally, our proposed budget, only slightly modified from the one in the proposal, will be justified. The budget itself is detailed at the end of this report All manuscripts published since the recent proposal was submitted are included with this progress report.

34462 (DOE/FTR–93014002) **Participation in the 3rd International conference on Ion microprobe research and technology: Foreign trip report, June 6–19, 1992.** Pontau, A.E. Sandia National Labs., Livermore, CA (United States). 15 Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93014002. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to improve Sandia's capability to conduct ion microbeam analysis for DP Programs and to publicly report our earlier measurements and present capabilities. I lead the Ion Microanalysis Group (IMAG) which consists of a total of about a dozen staff from both Sandia and Lawrence Livermore labs. We operate two microbeam analysis lines. There were three distinct phases of this trip with respect to development of IMAG's capabilities. The first portion of the trip consisted of participation in the 3rd International Conference on Nuclear Microprobe Technology and Applications including presenting one invited talk, one contributed poster, and chairing one technical session. The conference attracts the best Ion Microprobe scientists in the world to discuss the development of the microbeam techniques and equipment as well as representative applications. The second portion of the trip involved visiting two labs in Germany that employ ion beam techniques that may be adapted to our microbeam facility. The Germans use these techniques with millimeter-scale beams; we are exploring utilizing these tools on the micron scale. The third portion of the trip centered on evaluating the utility of a particular lens system used at Oxford with respect to installation on a new beamline in our lab. Questions existed as to whether their lens would be suitable for us because of our capability to operate with high-energy protons and heavy ions not available in most microbeam materials analysis labs. While in Oxford, I conducted several ray-tracing calculations with their staff, discussed likely operating scenarios and concluded that a particular lens system-model OM-150 would be most appropriate for IMAG. This process was completed in one full day instead of the two planned, allowing earlier return to the US.

34463 (INIS-mf–13549, pp. 113-121) **Neutron spectrometry of a bound multiphonon vibration as a method for study of impurities and radiation defects diffusion in metal.** Agranovich, V.M. (AN SSSR, Troitsk (Russian Federation). Inst. Spektroskopii); Dubovskij, O.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 10.* 214p. Order Number DE94600067. Source: OSTI; NTIS (US Sales Only); INIS.

The review of experimental and theoretical investigations of anharmonic vibrations in crystals is presented. The anharmonic vibrations of atoms cause an optical phonons interaction so the generation of the bound multiphonon complexes (bi phonon, tri phonon, etc.) is possible. The spectral terms of these complexes that are located on impurities are the best spectrometric indicators for defect formation process. These vibrations determine the atom diffusion parameter because their energies are approximately the same as the barrier height for the diffusion. 24 refs.; 1 fig. (author).

34467 (LA-UR–93-2556) **Older muons are wiser: Using time information in μLCR spectroscopy.** Leon, M. Los Alamos National Lab., NM (United States). 19 May 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306228–1: 6. international conference on muon spin rotation/relaxation/resonance, Maui, HI (United States), 7-11 Jun 1993). Order Number DE93018556. Source: OSTI; NTIS; INIS; GPO Dep.

For μLCR with slow polarization transfer, the weak resonance signals can be strengthened by delaying the positron observation period, for pulsed and chopped muon beams. Furthermore, the sensitivity to drifts can be reduced or eliminated by using the ratios of late to early e^+ counts. These possibilities for using time information are discussed quantitatively.

34468 (LIU-TEK-LIC–1993-11) **Electrical properties of InP/InGaAs heterojunction bipolar transistors.** Linkoeping Studies in Science and Technology. Ouacha, A. Linkoeping Univ. (Sweden). Dept. of Physics and Measurement Technology. May 1993. 33p. Order Number DE94600534. Source: OSTI; NTIS; INIS.

In recent years, there has been considerable interest in indium phosphide (InP) and In-based III-V compounds because of their applications in many electronic and photonic devices. The issues involved in processing high quality InP-based devices have been widely explored during the last decade. Realization of highly reliable, high speed, and long distance fiber-optics communication systems requires good quality of the material growth, characterization techniques and reproducible device processing concepts. All these three elements should be included in the manufacturing sequence in order to produce devices of high quality. Until recently, most of the InP related technologies and advances have been focused around optical fiber communications (1.3-1.55 μm) where Si and GaAs could not compete. The main obstacle to rapid growth of InP based technology in the 80s was the enormous investment and interest of large companies and commercial research organizations in GaAs technology. Supporting and financing InP related devices and material was at best minimal. As a consequence, there has been a much slower perhaps more realistic development curve for non-optical InP-based devices and technologies. InP technology has survived solely on the basic of its technical performance, despite the financial problems. In this thesis, we investigate the static behaviour of InP/InGaAs heterojunction bipolar transistors (HBTs) which have attracted a significant amount of attention. (20 refs., 5 figs., 3 tabs.).

34469 (ORNL/FTR–4645) **Travel to France to participate in an x-ray microprobe experiment at the European Synchrotron Radiation Facility and to discuss developments in x-ray optics and beamline control programs: Foreign trip report, May 19–26, 1993.** Ice, G.E. Oak Ridge National Lab., TN (United States). 9 Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93016209. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The European Synchrotron Radiation Facility (ESRF) is the first of the third-generation synchrotron radiation facilities. This impressive x-ray source is operating ahead of schedule with desip emittance and with better than desip current. The combination of small source size and collimated beams from third-generation sources make them attractive for the development of x-ray microprobe capabilities. At the ESRF the low beta insertion devices are particularly attractive for microfocusing with modest focal length optics. This trip provided an opportunity to test x-ray microfocusing optics on a third-generation source. Some simple measurements were made to illustrate the applications of an advanced x-ray microprobe to materials problems. The trip also afforded an opportunity to experience and discuss the performance of recent x-ray optical developments with ESRF scientists and to evaluate and discuss beamline computer control software with ESRF computer scientists.

34470 (ORNL/TM–12223) **Atom probe field ion microscopy and related topics: A bibliography 1991.** Russell, K.F.; Miller, M.K. Oak Ridge National Lab., TN (United States). Jan 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019104. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains a bibliography for 1991 on the following topics: Atom probe field ion microscopy; field desorption mass spectrometry; field emission; field ion microscopy; and field emission theory.

34471 (PNL-SA–21961) **Fourier transform ion cyclotron resonance versus time of flight for precision mass measurements.** Kouzes, R.T. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930274–4: Workshop on traps for antimatter and radioactive nuclei, Vancouver (Canada), 25-27 Feb 1993). Order Number DE93019170. Source: OSTI; NTIS; INIS; GPO Dep.

Both Fourier Transform Ion Cyclotron Resonance and ICR Time-of-Flight mass spectroscopy (FTICR-MS and ICR-TOF-MS, respectively) have been applied to precision atomic mass measurements. This paper reviews the status of these approaches and compares their limitations. Comparisons are made of FTICR-MS and ICR-TOF-MS for application to precision atomic mass measurements of stable and unstable nuclei, where the relevant scale is an accuracy of 1 keV and where halflives are longer than 10 milliseconds (optimistically). The atomic mass table is built up from mass chains, and ICR-MS brings a method of producing new types of mass chains to the mass measurement arena.

34472 (UCRL-JC–111857) **High resolution tomography of objects with access to a single side.** Thoe, R.S. Lawrence Livermore National Lab., CA (United States). 24 Mar 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930445–20: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93017992. Source: OSTI; NTIS; GPO Dep.

The author is developing a technique which will enable one to obtain high-contrast, high-spatial resolution, three-dimensional images in opaque objects. The only constraint will be the radiation source and detector(s) will be located on the same side of the object. The goal is to obtain images with a spatial resolution of ~1 mm at depths of 10 mm and ~3 mm at depths of 30 mm in materials of moderate density (brass, steel, etc.). The author's technique uses a highly-collimated beam of monochromatic gamma rays and a slit collimated high-resolution, high-efficiency, coaxial germanium spectrometer. If the geometry is well known, the spectrum of Compton scattered radiation can be used to map out the density as a function of depth. By scanning the object in two dimensions, a full three-dimensional image of the electron density can be reconstructed. The resolution is dependent on the incident beam collimation and the energy resolution of the spectrometer. For his system, the author anticipates a resolution of about 1 mm^3. The apparatus, reconstruction algorithms and current data verifying his predictions are presented here. Also included are the details on how the system can be modified to increase the efficiency by over two orders of magnitude. This system will have several advantages over conventional transmission radiographic and tomographic systems: (1) It requires the use of a high specific intensity isotopic source of modest activity (< 100 mCi). (2) It requires only a single

high-resolution spectrometer used in conjunction with an array of low-resolution detectors (all readily available). (3) It allows for the recording of three-dimensional images of object even though both detector and source are located on the same side of the object.

The concentration profiles of the radioactive isotopes produced by the nuclear reactions in GaAs and in high-temperature superconductor $YBa_2Cu_3O_7$ irradiated by alpha-particles with energy 12, 16 and 20 MeV are determined. The fluences were 10^{15} - $10^{16}cm^{-2}$. The concentration of the isotopes (^{72}As,^{73}As,^{74}As,^{77}Br in the case of GaAs, ^{66}Ga,^{67}Ga,^{67}Cu,^{92}Nb,^{140}Ba,^{141}Ce in the case of $YBa_2Cu_3O_7$) is of order 10^{13}-$10^{14}cm^{-3}$, the depth of the profile being in the range 20-100μm depending upon the energy: the depth increases with energy. The specific feature of some profiles (^{72}As,^{74}As,^{92}Nb) is found, namely the existence of the maximum. This feature is interpreted as a consequence of the non-monotonous energy dependence of the nuclear reaction cross-section. 5 refs.; 4 figs. (author).

This seminar is aimed at understanding both the physical and chemical aspects of the structural changes of materials induced by photons or ionizing radiation. The seminar was held on December 19th, 1991 and from February 13 to 14th, 1992 in this institute. The most active areas of the material science, in addition to the previous subjects, such as organic superconductors, silicon-based polymers, and fullerenes were included in this seminar. (J.P.N.).

6654 Quantum Physics Aspects of Condensed Matter

34485 (ANL/MSD/CP–80489) **Crossover between BCS and performed-Boson theories with increasing interactions.** Randeria, M. Argonne National Lab., IL (United States). Aug 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930865–1: International conference on strongly correlated electron systems, La Jolla, CA (United States), 16-19 Aug 1993). Order Number DE93019018. Source: OSTI; NTIS; INIS; GPO Dep.

The author reviews recent work on Fermi systems with attractive interactions of arbitrary strength. First, he describes the results of a functional integral formulation to study the crossover from cooperative Cooper pairing to independent bound state formation and condensation. The inadequacy of a saddle point approximation with increasing coupling is pointed out, and the importance of temporal (quantum) fluctuations for normal state properties at intermediate and strong coupling is emphasized. Next, results from a quantum Monte Carlo simulation of the 2D attractive Hubbard model are described. The intermediate coupling normal state is found to deviate markedly from a canonical Fermi liquid: "spin-gap" behavior, with $1/T_1T \sim \chi(T)$, is found in a degenerate Fermi system.

34486 (ANL/ET/CP–78928) **Fabrication and characterization of high-T_c tapes and coils made from Ag-clad Bi-2223 superconductors.** Balachandran, U. (Argonne National Lab., IL (United States)); Iyer, A.N.; Youngdahl, C.A.; Motowidlo, L.R.; Hoehn, J.G. Jr.; Haldar, P. Argonne National Lab., IL (United States). Jul 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9308122–1: 3. international conference on advanced materials, Tokyo (Japan), 31 Aug - 4 sep 1993). Order Number DE93018615. Source: OSTI; NTIS; GPO Dep.

Prereacted Pb-doped Bi-Sr-Ca-Cu-0 powders were packed into Ag tubes, drawn, rolled, and given intermediate heat treatment to prepare long lengths of Ag-clad Bi-2223 superconductor tapes. With the use of improved process conditions, transport critical current density (J_c) values exceeding 10^5 A/cm^2 at 4.2 K and 27 K, and greater than 4×10^4 A/cm^2 at 77 K, were obtained in zero applied field with short tape samples. Detailed microstructural analysis and J_c measurements in applied fields up to 20 T are reported. Rolled tapes were cut into lengths of up to 10 m, and several such tapes were used in parallel to fabricate small superconducting pancake coils by the "wind-and-react" technique. Recently, we fabricated a test magnet with six pancake coils, each containing three 10-m lengths of rolled tapes and tested at 4.2, 27, and 77 K as a function of applied fields up to 14.5 T. A maximum generated field of 1.25 T was measured in zero applied field at 4.2 T. Detailed measurements made on the pancake coils and test magnets are reported in this paper.

34487 (ANL/ET/CP–80302) **Fabrication and characteristics of a test magnet from HTS Bi-2223 silver-clad tapes.** Haldar, P. (Intermagnetics General Corp., Guilderland, NY (United States)); Hoehn, J.G. Jr.; Motowidlo, L.R.; Balachandran, U.; Iwasa, Y. Argonne National Lab., IL (United States). Jul 1993. 12p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930703–19: International cryogenic engineering conference and international cryogenic materials conference, Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE93018624. Source: OSTI; NTIS; GPO Dep.

Critical currents of powder-in-tube processed silver-clad Bi-2223 short tape samples and coils have been measured at liquid nitrogen (77 K), liquid neon (27 K) and liquid helium (4.2 K) temperatures. The short samples have been characterized in fields up to 20 T and indicate a large anisotropy at 27 K with resistive behavior above 15 T in the worst field direction. A test magnet consisting of pancake coils generated magnetic fields greater than 1.0, 0.7 and 0.11 T at 4.2 K, 27 K and 77 K respectively. The ctest magnet generates significant self-fields in background fields up to

14.5 T at 4.2 K and 27 K. Optimization of thermo-mechanical process parameters have yielded J_c's in the superconducting core > 4.0×10^4 A/cm^2 at 77 K, zero field and > 2.0×10^5 A/cm^2 at 4.2 K, zero field for short tape samples. Long lengths (>30 m) of silver-clad tape superconductors have also been fabricated and tested to carry significant amounts of current (J_c core > 10,000 A/cm^2) at 77 K. Overall J_c of short and long samples and characteristics of the test magnet are reported.

34488 (DOE/ER/40150–214) **Solvents and pumpdown characteristics of SRF Nb cavities.** Rao, M.G.; Kneisel, P.; Dylla, H.F. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. Jun 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-PR–93-020;CONF-930511–261: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93017510. Source: OSTI; NTIS; INIS; GPO Dep.

High-performance superconducting radio frequency (SRF) cavities are placed under UHV and low particulate conditions when they go through the surface treatment process, and are kept under these conditions permanently thereafter, both before and during use in the accelerator. The outgassing of the gasket material in the gate valves and the outgassing of the gasket material in the gate valves and the outgassing of the solvents that come in contact with the gasket and the cavity surfaces determine the ultimate pressure that can be obtained in the cavity. A systematic study of gaskets and various solvents was undertaken in order to understand the conditions that lead to a low ultimate pressure in a short period of time. Results with Kalrez, Vito O-rings and solvents like methanol, acetone, isopropyl and freon are presented in this paper. Also, we discuss the effect of a slow or fast initial pumpdown in order to prevent the settlement of particulates due to condensation.

34489 (DOE/FTR–93011426) **[Travel to Japan to participate in the International Superconducting Symposium]: Foreign trip report, November 6–25, 1992.** Howell, R.H. Lawrence Livermore National Lab., CA (United States). 10 Dec 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93011426. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report will describe the activities at the International Superconducting Symposium, ISS'92. ISS'92 contained in its scope the fabrication, and analysis of superconducting materials and their applications. It is next in a series of meetings held in Japan, sponsored by ISTEC, a Japanese organization dedicated to basic and precompetitive research in superconductivity. The meeting is international in scope but is heavily attended by the Japanese and along with ISTEC activities gives an overview of the state of Japanese basic and industrial research in superconductivity. Also described are visits by the traveler to Japanese ISTEC and other laboratories and universities conducting superconducting or materials research.

34490 (INIS-mf–13548, pp. 154-157) **Superconductors with voids superlattice.** Rud'ko, V.N. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Sugakov, V.I.; Shevtsova, O.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 9.* 225p. Order Number DE94600002. Source: OSTI; NTIS (US Sales Only); INIS.

Superconductors with pore superlattice or with inclusion of another phase in magnetic fields were investigated. The dependence of third critical field H_{c3} on pore dimensions was found; diamagnetic properties of a system and current states of superconducting condensate were studied. At $H \leq H_{c2}$ parameters of vortex lattice depending on magnetic field and superlattice parameters were found and dependence of critical current on magnetic field value direction was investigated. 4 refs.; 2 figs. (author).

34492 (ORNL/FTR–4582) **Participation in the international symposium on high-$T_c$superconductivity and its applications (ISHTCS) held in Cairo, Egypt: Foreign trip report, April 3–18, 1993.** Wood, R.F. Oak Ridge National Lab., TN (United States). 3 May 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013712. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler was invited to attend the ISHTCS in Cairo and to give a series of three lectures on his spin-polaron theory of high-$T_c$superconductivity and one lecture on superconducting superlattices. In addition, two days were spent at Ain Shams University where discussions with the faculty were held and another lecture on laser ablation and superconducting superlattices was given. The traveler also served on an ad hoc studying the feasibility of establishing a "national laboratory" for high-$T_c$superconductivity.

34493 Method and apparatus for dissipating remanent fields and preserving diamagnetism of ceramic superconductors. Youngdahl, C.A. To Dept. of Energy. 1991. USA patent application 7-728,477. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93019340. Source: OSTI; NTIS; GPO Dep.

A method for dissipating a remanent field, created when a magnetic field is brought into contact with a superconductor, comprising the steps of (1) providing a ceramic superconductor; (2) continuously or intermittently applying an AC current to the ceramic superconductor; (3) gradually removing the AC current until the undesired remanent field is dissipated.

34494 (ETDE-IT–93-203) **Evaluation of some low activation structural materials for minimizing radioactive waste production by future nuclear fusion power plants.** Donato, A. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)). 1993. 6p. (CONF-921101–138: 16. Materials Research Society fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93522953. Source: OSTI; NTIS (US Sales Only).

Taking into account neutron activation (Bq/kWht) and environmental impact in terms of Ingestion Toxic Potential (IT, cu. m H_2O-kWht) of radioactive wastes coming from several low activation structural material candidates for future nuclear fusion power reactors, the contribution of the material chemical composition elements and impurities, to overall radioactivity and IT, was assessed. The chemical impurities, also at very low concentrations, were ascertained to give in many cases a considerable contribution to the radioactive wastes environmental impact, as in the case of SiC/SiC fiber composites materials or low activation martensitic steels. Impurities origin was identified. Efforts to ameliorate the material production processes for nuclear fusion application are suggested.

7003 Plasma Physics and Fusion Research

34495 (CONF-931115–6) **Multi-CPU plasma fluid turbulence calculations on a CRAY Y-MP C90.** Lynch, V.E. (Oak Ridge National Lab., TN (United States)); Carreras, B.A.; Leboeuf, J.N.; Curtis, B.C.; Troutman, R.L. Oak Ridge National Lab., TN (United States). [1993]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Supercomputing conference on high performance computing and communications; Portland, OR (United States); 15-19 Nov 1993. Order Number DE93015425. Source: OSTI; NTIS; INIS; GPO Dep.

Significant improvements in real-time efficiency have been obtained for plasma fluid turbulence calculations by microtasking the nonlinear fluid code KITE in which they are implemented on the CRAY Y-MP C90 at the National Energy Research Supercomputer Center (NERSC). The number of processors accessed concurrently scales linearly with problem size. Close to six concurrent processors have so far been obtained with a three-dimensional nonlinear production calculation at the currently allowed memory size of 80 Mword. With a calculation size corresponding to the maximum allowed memory of 200 Mword in the next system configuration, we expect to be able to access close to nine processors of the C90 concurrently with a commensurate improvement in real-time efficiency. These improvements in performance are comparable to those expected from a massively parallel implementation of the same calculations on the Intel Paragon.

34496 (CTH-ED–146-L) **Impurity effects on toroidal ITG-modes and transport in tokamaks.** Froejdh, M. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. Apr 1993. 29p. Order Number DE94600467. Source: OSTI; NTIS; INIS.

The presence of impurities in tokamak plasmas has until recently been ignored in several fluctuation driven transport models. In this thesis some of the consequences of including an ion impurity species into a model for low frequency electrostatic modes and fluctuation driven transport are discussed. The direction of the particle flows in a two-ion-component plasma is studied for the outer part of the good confinement region. When the two ion species, main and impurity ions, have similar inwardly peaked density profiles the latter tends to determine the flow directions for typical tokamak plasma conditions. Hence, the impurities flow outwards and the main ions inwards, leading to so called plasma decontamination. The stability of the toroidal main and impurity ion temperature gradient modes (ITG-modes) is determined by using an advanced fluid model. The impurity effect on the background mode is found to be stabilizing for a large domain of parameters. However, a destabilization is also possible. An impurity mode driven by toroidicity is found and shown to be unstable in a new parameter region. The particle and thermal diffusivities are estimated and the scaling properties are studied. The magnitude of the ion thermal conductivity is shown to decrease due to the stabilizing influence of impurities. The radial variation of the transport coefficients are considered for some experimental equilibrium profiles. The stability properties of a contaminated tokamak plasma with dissipative trapped electrons are investigated. The dissipation is found to change the instability thresholds. The relation between wave energy, electron dissipation and instability is discussed. (35 refs.).

34497 (CTH-IEFT-PP–1992-29) **Transport due to ion temperature gradient driven magnetic drift modes.** Heikkilae, A.; Weiland, J. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. [1992]. 43p. Order Number DE94600434. Source: OSTI; NTIS; INIS.

An advanced reactive fluid model is used to study the transport due to the toroidal η_i mode in the flat density limit. In this limit the density gradient scale length scales out from both the linear dispersion relation and the quasi-linear transport coefficients. Simplified transport coefficients are derived for the flat density limit including also influence of electron trapping. The scaling properties with respect to various dimensionless parameters are discussed. In particular the scaling $\chi_i \approx \eta_i - \eta_{i_{th}}$, which has also been derived by other authors for somewhat different situations, is found to be the relevant scaling in typical situations. A stabilizing and transport reducing effect of a high degree of electron trapping is pointed out. (authors) (33 refs.).

34498 (CTH-IEFT-PP–1993-01) **Reactive drift wave model for Tokamak transport.** Nordman, H.; Weiland, J. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. [1993]. 13p. Order Number DE94600468. Source: OSTI; NTIS; INIS.

Transport due to toroidal η_i and collisionless trapped electron modes is studied using an advanced reactive fluid model. Transport code simulation of DIII-D and JET discharges are analyzed. The recent experimental results with off axis electron cyclotron heating in the DIII-D tokamak are recovered with inward flow of electron energy and peaked electron temperature profile. For the JET equilibria the model give heat diffusivities of the correct order of magnitude which grow with radius up to r/a = 0.8. (authors) (22 refs.).

34499 (DOE/ER/53291–4) **Theoretical studies of turbulence and anomalous transport in toroidal confinement devices.** Terry, P.W. Wisconsin Univ., Madison, WI (United States). Dept. of Physics. [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER53291. Order Number DE93040684. Source: OSTI; NTIS; INIS; GPO Dep.

The research performed under this grant has focused on key issues with respect to turbulence and transport in toroidal confinement devices. Progress and publications in these areas are summarized in this report. This work includes analytical and numerical studies of spectral energy transfer and the saturation dynamics and transport of dissipative and collisionless trapped electron turbulence, the role of flow curvature in L-H mode transition physics, fully nonlinear calculations of the anomalous particle transport from the ion mixing mode, and the development of a theory for the drift wave frequency spectrum. Novel aspects of this work include an elucidation of the role of nonlinear frequency shifts in producing nonstationary saturated states, an identification of reverse and non-conserved flows in Hasegawa-Mima turbulence, and a description of the way incoherent emission affects the frequency of turbulent fluctuations.

34500 (DOE/ER/54089–2) **Advanced fusion diagnostics: Final technical report, July 15, 1991–July 14, 1993.** Moses, K.G. Fusion Physics and Technology, Torrance, CA (United States). 14 Jul 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER54089. Order Number DE93040085. Source: OSTI; NTIS; INIS; GPO Dep.

Key among various issues of ignited plasmas is understanding the physics of energy transfer between thermal plasma particles and magnetically confined, highly energetic charged ions in a tokamak device. The superthermal particles are products of fusion reactions. The efficiency of energy transfer by collisions, from charged fusion products (e.g., α-particles) to plasma ions, grossly determines whether or not plasma conditions are self-sustaining without recourse to auxiliary heating. Furthermore, should energy transfer (efficiency be poor, and substantial auxiliary heating power is required to maintain reacting conditions within the plasma, economics may preclude commercial viability of fusion reactors. The required charged fusion product information is contained in the energy distribution function of these particles. Knowledge of temporal variations of the superthermal particle energy distribution function could be used by a fusion reactor control system to balance plasma conditions between thermal runaway and a modicum of fusion product energy transfer. Therefore, diagnostics providing data on the dynamical transfer of alpha-particle and other charged fusion product energy to the plasma ions are essential elements for a fusion reactor control system to insure that proper plasma conditions are maintained. The objective of this work is to assess if spectral analysis of rf radiation emitted by charged fusion products confined in a magnetized plasma, called ion cyclotron emission (ICE), can reveal the vital data of the distribution function of the superthermal particles.

34501 (DOE/ET/51013–T248) **The development of an Omegatron plasma ion mass spectrometer for Alcator C-Mod.** Thomas, E.E. Jr. Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center. May 1993. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-78ET51013. (PFC/RR–93-3). Order Number DE93017617. Source: OSTI; NTIS; INIS; GPO Dep.

A new diagnostic device, the Omegatron Probe, has been developed to investigate relative impurity levels and impurity charge state distribution in the Alcator C-Mod Tokamak edge plasma. The Omegatron probe consists of two principal components, a "front-end" of independently biased grids, arranged in a gridded energy analyzer fashion and a large collection cavity. Particles enter the probe in a thin "ribbon" through a knife-edge slit. The grids provide a means to measure and control the parallel energy distribution of the ions. In the collection cavity, an oscillating electric field is applied perpendicularly to the ambient magnetic field. Ions whose cyclotron frequencies are resonant with this electric field oscillation will gain perpendicular energy and be collected. In this way, the probe can be operated in two modes: first, by fixing the potentials on the grids and sweeping frequencies to obtain a " Z/m spectrum" of ion species and second, by fixing the frequency and sweeping the grid potentials to obtain the distribution function of an individual impurity species. The Omegatron probe performed successfully in tests on a Hollow Cathode Discharge (HCD) linear plasma column. It obtained measurements of $T_e \approx 5$ eV, T_i (H^+) $\approx 2.0 \pm 0.2$ eV, $n_0 \approx 9 \times 10^{15}$ m^{-3}, RMS potential fluctuation levels of $\sim 0.5 \pm 0.05 \pm T_e$, and obtained "Z/m" spectra for the plasma ions (H^+, H_2^+, He^+). Additional experiments confirmed the theoretical scalings of the $f/\delta f$ resolution with the applied electric field and magnetic field strengths. The instrument yielded an absolute level of resolution, $f/\delta f$, of approximately 2.5 to 3 times the theoretical values. Finally, the results from the HCD are used to project operation on Alcator C-Mod.

34502 (DOE/ET/53088–546) **On neutral plasma oscillations.** Shadwick, B.A.; Morrison, P.J. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–546). Order Number DE93040319. Source: OSTI; NTIS; INIS; GPO Dep.

We examine the conditions for the existence of spectrally stable neutral modes in a Vlasov-Poisson plasma and show that for stable equilibria of systems that have unbounded spatial domain, the only possible neutral modes are those with phase velocities that correspond to stationary inflection points of the equilibrium distribution function. It is seen that these neutral modes can possess positive or negative free energy.

34503 (DOE/ET/53088–609) **Ion mobility and transport barriers in the tokamak plasmas.** Xiao, H. (Texas Univ., Austin, TX (United States). Inst. for Fusion Studies); Hazeltine, R.D.; Valanju, P.M.; Zhang, Y.Z. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Jun 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–609). Order Number DE93040320. Source: OSTI; NTIS; INIS; GPO Dep.

The character of charged particle motion in an axisymmetric toroidal system with a constant radial electric field is investigated both analytically and numerically. Ion radial mobility caused by the combined effects of the radial electric field and charge exchange is found. A simple moment argument in the banana regime matches the simulation results well. Relation of present work and high confinement (H-mode) experiment is also discussed.

34504 (DOE/ET/53088–616) **Finite beta plasma equilibrium in toroidally linked mirrors.** Ilgisonis, V.I.; Berk, H.L.; Pastukhov, V.P. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Jul 1993. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–616). Order Number DE93040318. Source: OSTI; NTIS; INIS; GPO Dep.

The problem of finite pressure plasma equilibrium in a system with closed magnetic field lines consisting of quadrupole mirrors linked by simple toroidal cells with elliptical cross-sections is analyzed. An appropriate analytical procedure is developed, that uses conformal mapping techniques, which enables one to obtain the magnetic field structure for the free boundary equilibrium problem. This method has general applicability for finding analytic solutions of the two-dimensional Dirichlet problem outside of an arbitrary closed contour. Using this method, the deformations of the plasma equilibrium configuration due to finite plasma pressure in the toroidal cell are calculated analytically to the second order in λ-expansion, where $\lambda \sim \beta/\epsilon E$, β is the ratio of plasma pressure to the magnetic field pressure, ϵ is the inverse aspect ratio and E is the ellipticity of the plasma cross-section. The outer displacement of the plasma column is shown to depend nonlinearly on the increase of plasma pressure, and does not prevent the achievement of substantial $\beta \sim 10\%$ in the toroidal cells.

34505 (ENEA-RTI-INN–92-16) **Magnetohydrodynamic equilibria and poloidal field systems for IGNITOR-ULT.** Cenacchi, G. (ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione); Coppi, B.; Lanzavecchia, L. Nov 1992. 42p. (RTI-INN–92-16). Order Number DE93522950. Source: OSTI; NTIS (US Sales Only).

The ideal magneto-hydro-dynamic (MHD) equilibrium configurations of the plasma column and the relevant poloidal field system appropriate for an advanced compact ignition experiment (IGNITOR-ULT) were analyzed. The plasma geometry evolution during the current pulse and proper series of MHD equilibria referring to the most advanced operating regime proposed were envisaged. The plasma start-up phase was also investigated. Current values to be fed into the poloidal field windings were derived for producing a set of optimal plasma confinement configurations. In the machine design adopted, the air-core transformer and the equilibrium field coils are combined into a convenient set of windings that reduces the overall current requirements, while preserving the ability to induce the desired plasma currents, and the equipment can be accomodated within the supporting structure of the machine. The results obtained show that the proposed PFC system can produce and maintain the designed plasma equilibrium configurations over a wide range of plasma parameters, with good safety margins against macroscopic instabilities.

34506 (GTFR–108) **Viscosity in the edge of tokamak plasmas.** Stacey, W.M. Georgia Inst. of Tech., Atlanta, GA (United States). May 1993. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER52141. Order Number DE93018039. Source: OSTI; NTIS; INIS; GPO Dep.

A fluid representation of viscosity has been incorporated into a set of fluid equations that are maximally ordered in the "short-radial-gradient-scale-length" (srgsl) ordering that is appropriate for the edge of tokamak plasmas. The srgsl ordering raises viscous drifts and other viscous terms to leading order and fundamentally alters the character of the fluid equations. A leasing order viscous drift is identified. Viscous-driven radial particle and energy fluxes in the scrape-off layer and divertor channel are estimated to have an order unity effect in reducing radial peaking of energy fluxes transported along the field lines to divertor collector plates.

34507 (INIS-RU–352, pp. 9-11) **Increase of electromagnetic radiation frequency in interaction with nonlinear plasma waves.** Bulanov, S.V. (AN SSSR, Moscow (Russian Federation). Inst. Obshchej Fiziki); Kirsanov, V.I.; Naumova, N.M.; Sakharov, A.S.; Inovenkov, I.N. AN SSSR, Moscow (Russian Federation). Fizicheskij Inst. 1991. (In Russian). In *Short communications on physics. Experimental and theoretical physics. No. 6.* 42p. Order Number DE94600073. Source: OSTI; NTIS (US Sales Only); INIS.

Interaction of electromagnetic radiation with nonlinear plasma waves (NPW) was studied. It is shown that the noticeable reflection is realized on sharp electron concentration jumps in reversing NPW, for which electron maximum velocity is equal to or greater than the phase velocity of relativistic plasma waves. The interaction with one of jumps is considered, as the reversing takes place not simultaneously in all maxima, when the wake waves are excited. When NPW are excited by a short pulse of high-power laser radiation with carrier frequency $\omega_0 > \omega_1 >> \omega_p$ (where ω_1 is the incident wave frequency and ω_p is the Langmuir frequency), the reflected wave intensity increases approximately as the ratio $(\omega_0/\omega_1)^{8/3}$. The conclusion is made that the frequency increase can be accompanied by sufficiently efficient energy conversion, when electromagnetic radiation is reflected on fast Langmuir wave close to reversing.

34508 (INIS-RU–352, pp. 38-41) **On the theory of electron distribution during cyclotron absorption of electromagnetic field in plasma.** Novikov, V.N.; Ovchinnikov, K.N.; Silin, V.P.; Uryupin, S.A. AN SSSR, Moscow (Russian Federation). Fizicheskij

Inst. 1991. (In Russian). In *Short communications on physics. Experimental and theoretical physics. No. 6.* 42p. Order Number DE94600073. Source: OSTI; NTIS (US Sales Only); INIS.

The evolution of electron distribution in completely ionized plasma located in constant homogeneous magnetic field and circular polarized hf electric field, was studied. The solution was realized with account for electron-electron collisions and for frequency nonequal to the cyclotron resonance one. The equation describing time variations of the electron thermal motion energy, was derived. The equation was solved numerically. The dependences of the electron distribution evolution and absorbed power on parameter α characterizing the hf field intensity, were obtained for the field frequencies close to the electron cyclotron one. As α grows the degree of the distribution function deviation from the Maxwell curve increases and heating rate grows as well, which leads to distribution transformation into the Maxwell one.

34509 (IRF–211) **Phase-space description of plasma waves. Linear and nonlinear theory.** Biro, T. (Swedish Inst. of Space Physics, Umeaa Univ. (Sweden)). Swedish Inst. of Space Physics, Kiruna (Sweden). Nov 1992. 10p. Order Number DE94600492. Source: OSTI; NTIS; INIS.

We develop an (r,k) phase space description of waves in plasmas by introducing Gaussian window functions to separate short scale oscillations from long scale modulations of the wave fields and variations in the plasma parameters. To obtain a wave equation that unambiguously separates conservative dynamics from dissipation also in an inhomogeneous and time varying background plasma, we first discuss the proper form of the current response function. On the analogy of the particle distribution function f(v,r,t), we introduce a wave density N(k,r,t) on phase space. This function is proven to satisfy a simple continuity equation. Dissipation is also included, and this allows us to describe the damping or growth of wave density' along rays. Problems involving geometric optics of continuous media often appear simpler when viewed in phase space, since the flow of N in phase space is incompressible. Within the phase space representation, we obtain a very general formula for the second order nonlinear current in terms of the vector potential. This formula is a convenient starting point for studies of coherent as well as turbulent nonlinear processes. We derive kinetic equations for weakly inhomogeneous and turbulent plasma, including the effects of inhomogeneous turbulence, wave convection and refraction. (author).

34510 (KFKI–1992-29/D) **Modeling the cathode region of noble gas mixture discharges using Monte Carlo simulation.** Donko, Z.; Janossy, M. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Oct 1992. 39p. Order Number DE94600527. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Journal of Physics D: Applied Physics.

A model of the cathode dark space of DC glow discharges was developed in order to study the effects caused by mixing small amounts ($\leq$2%) of other noble gases (Ne, Ar, Kr and Xe) to He. The motion of charged particles was described by Monte Carlo simulation. Several discharge parameters (electron and ion energy distribution functions, electron and ion current densities, reduced ionization coefficients, and current density-voltage characteristics) were obtained. Small amounts of admixtures were found to modify significantly the discharge parameters. Current density-voltage characteristics obtained from the model showed good agreement with experimental data. (author) 40 refs.; 14 figs.

34511 (LA-UR–93-2769) **Facility for intense diagnostic neutral beam (IDNB) development.** Kasik, R.J.; Hinckley, W.B.; Bartsch, R.R.; Rej, D.J.; Henins, I.; Greenly, J.B. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930616–15: 9. IEEE pulsed power conference, Albuquerque, NM (United States), 21-23 Jun 1993). Order Number DE93018288. Source: OSTI; NTIS; INIS; GPO Dep.

An intense, pulsed neutral beam source is under development for use as a probe beam on hot, burning plasmas such as in the international thermonuclear experimental reactor (ITER) which is presently in the planning stage. A pulsed, neutral hydrogen beam of 10s of kilo amperes of current can have an alpha particle, charge-exchange-recombination-spectroscopy (alpha-CHERS) signal-to-noise ratio of $\sim$ 10. This beam would allow the measurement, on a single pulse of a few hundred nanoseconds duration, of the local alpha particle distribution function as well as other features of the tokamak plasma such as current density profile, impurity density, and microturbulence spectrum. The cross-sections for the CHERS diagnostic dictate operation with proton energies greater than ~50keV. A pulsed neutral hydrogen source of this voltage and intensity can be achieved by neutralizing the ion flux from a magnetized ion-diode. The cross-sections for attachment and stripping, when coupled with scaling from Child-Langmiur, space-charge-limited, ion-current flow imply operation below ~ 100keV for maximum neutral fluence. The development of a flashover-anode, ion source for forthcoming evaluation of a neutralizing section is described below. This source operates in the accelerator voltage range 70 to 100keV. Eventually, the flashover-anode, magnetized ion-diode will be replaced with a plasma-anode, magnetized ion-diode.

34512 (NIFS–205) **A compact neutron counter telescope with thick radiator (COTETRA) for fusion experiment.** Osakabe, M. (The Graduate Univ. for Advanced Studies, Nagoya (Japan)); Itoh, S.; Gotoh, Y.; Sasao, M.; Fujita, J. National Inst. for Fusion Science, Nagoya (Japan). Jan 1993. 33p. Order Number DE93520241. Source: OSTI; NTIS; INIS.

A new type of neutron spectrometer, based on recoil proton measurement, has been developed for diagnosing a DT fusion plasma. This spectrometer has such advantages as: 1. direct measurement of the neutron energy without the unfolding procedure, 2. relatively high detection efficiency for 14 MeV neutrons, 3. a wide dynamic range of counting rate, and 4. perfect n-γ discrimination. To examine the performance of this spectrometer, we developed a Monte Carlo simulation code. It predicts that we may achieve energy resolution up to 3 % with a detection efficiency of 10^{-5} [count cm^2/n] if we could successfully adjust the condition of the spectrometer. A prototype spectrometer was constructed and was compared with the Monte Carlo prediction. The energy resolution of 5.3 $\pm$ 0.7 % for 14 MeV neutron was obtained for the prototype spectrometer and the calculation agrees with the experimental results within its margin of error if we take into account the intrinsic energy resolution of the detector that is used in the prototype. (author).

34513 (PPPL–2925) **Control of the current density profile with lower hybrid current drive on PBX-M.** Bell, R.E. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Bernabei, S.; Chu, T.K.; Gettelfinger, G.; Greenough, N.; Hatcher, R.; Ignat, D.; Jardin, S.; Kaita, R.; Kaye, S.; Kozub, T.; Kugel, H.; LeBlanc, B.; Okabayashi, M.; Paul, S.; Sauthoff,Princeton Univ., NJ (United States). Plasma Physics Lab. Jul 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-9304112–20: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93017518. Source: OSTI; NTIS; INIS; GPO Dep.

Lower hybrid current drive (LHCD) is being explored as a means to control the current density profile on PBX-M with the goal of raising the central safety factor q(O) to values of 1.5-2 to facilitate access to a full-volume second stable regime. Initial experiments have been conducted with up to 400 kW of 4.6 GHz LH power in circular and indented plasmas with modest parameters. A tangential-viewing two-dimensional hard x-ray imaging diagnostic has been used to observe the bremsstrahlung emission from the suprathermal electrons generated during LHCD. Hollow hard x-ray images have indicated off-axis localization of the driven current. A serious obstacle to the control of the current density profile with LHCD is the concomitant generation of MHD activity, which can seriously degrade the confinement of suprathermal electrons. By combining neutral beam injection with LHCD, an MHD-free condition has been obtained where q(O) is raised above 1.

34514 (SAND–93-0425C) **Application of piezoelectric stress gauges to the measurement of fast-rise-time multimegampere electric currents.** Hanson, D.L. (Sandia National Labs., Albuquerque, NM (United States)); Spielman, R.B.; Seamen, J.F.; Struve, K.W. Sandia National Labs., Albuquerque, NM (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United

States). DOE Contract AC04-76DP00789. (CONF-930676–3: 14. international conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO (United States), 27 Jun - 2 jul 1993). Order Number DE93017625. Source: OSTI; NTIS; GPO Dep.

Modeling of load behavior in Z-pinch plasma radiation sources driven by high current generators requires accurate measurement of fast-rise-time multimegampere electrical currents close to the load. Using a novel application of high pressure technology, we have demonstrated that fast-response piezoelectric stress transducers can measure such currents under conditions of extremely high current density, induced electric fields, and bremsstrahlung radiation where conventional current diagnostics fail. Large signal, nanosecond-time-resolution lithium niobate piezoelectric stress gauges are employed to directly measure the magnetic pressure $B^2/2\mu_0 = \mu_0 I^2/8\pi^2 r^2$ generated at radius r by a current I flowing in a radial transmission line near the load of a pulsed power current source. With a current diagnostic consisting of a pure tungsten electrode on a Y-cut lithium niobate stress gauge, current densities up to $1/2\pi cr$ = 78MA/m can be measured before the electrode yield strength and piezoelectric operating stress limit are exceeded. Based on this work, we have developed a compact modular current probe for use on the high current (20–25 MA) DECADE simulator being constructed for the Defense Nuclear Agency. We also describe recent work extending this measurement technique to higher current densities (125 MA/m) using a cooper-sapphire electrode impedance stack on an X-cut quartz piezoelectric element.

34515 (TRITA-ALF–92-07) **Determination of toroidal equilibrium parameters from magnetic probe measurements.** Brynolf, J. (Uppsala Univ. (Sweden). Dept. of Technology); Eriksson, H.G.; Persson, H.; Hellblom, G. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Dec 1992. 30p. Order Number DE94600437. Source: OSTI; NTIS; INIS.

A method has been developed by which the poloidal flux function in the vacuum region between the plasma and the external conductors (and the iron core) can be deduced from external magnetic field measurements. The plasma is in equilibrium and the solution is restricted to plasmas without irregularities. The poloidal field components $B\theta$ and B_r are measured at different poloidal positions outside the liner and modelled by truncated Fourier series. The Grad-Shafranov equation in the vacuum region is then solved with these modelled values of $B\theta$ and B_r as boundary conditions. (authors).

34516 (TRITA-ALF–92-08) **An elegant method to estimate helium-like ion densities from visible plasma spectroscopy.** Zastrov, K.D. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Physics); Hoerling, P.; Rachlew-Kaellne, E.; Brzozowski, J.H. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Dec 1992. 15p. Order Number DE94600464. Source: OSTI; NTIS; INIS.

A method is presented to estimate time resolved densities of He-like carbon and oxygen ions from the observation of Li-like $1s^2 3p \rightarrow 1s^2 3s$ transitions based on a 0-dimensional model for plasmas with short particle confinement times. General coefficients for this study are derived. The method is applied to Extrap-T1 RFP data. (authors).

34517 (TRITA-ALF–92-09) **Soft X-ray diagnostic at the EXTRAP-T1 experiment.** Voronin, A. (A.F. Ioffe Physico-Technical Institute, St. Petersburg (Russian Federation)); Welander, A. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Dec 1992. 25p. Order Number DE94600465. Source: OSTI; NTIS; INIS.

Results of investigating the soft x-ray wavelength region of reversed field pinch (RFP) discharges at the EXTRAP-T1 device are presented. A non-dispersive technique based on the multiple-filters method has been developed to measure the electron temperature and plasma instabilities. Time resolved local temperature measurements of 100-300 eV near the torus axis were carried out. The electron temperature dependence on plasma current and conditions of the operation of the device has been experimentally established. (authors).

34518 (TRITA-ALF–92-10) **A two-filter soft x-ray spectrometer for plasma electron temperature measurement.** Voronin, A. (A.F. Ioffe Physico Technical Inst., St. Petersburg (Russian Federation)); Welander, A.; Drake, J.R. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Dec 1992. 13p. Order Number DE94600466. Source: OSTI; NTIS; INIS.

The ratio of the intensity of continuum soft x-ray radiation in a selected wavelength region free from line radiation, measured by two different multiple-filter detectors, is used to estimate the electron temperature in a fusion plasma experiment. The detectors are silicon surface barrier diodes, each covered with different filters, selective for the same continuum interval but having different transmission dependencies on temperature. The ratio of the signal intensity is then temperature dependent but independent of plasma density. A criterion for the ratio method to be dependable is that the wave length region observed must be free from line radiation since the ratio of line radiation intensities would be dependent on species density as well as temperature. The wavelength region selected is 45-70 Aa which is free of oxygen and carbon line radiation, which are the dominant impurities in many fusion plasma experiments. The electron temperature range suitable for measurement is dependent on the filter parameters. Two cases have been developed which are suitable for temperature ranges of 50-150 eV and 100-300 eV. The electron temperature measurements are in good agreement with Thomson scattering measurements and measurements derived from line ratios in the vacuum ultraviolet wavelength region. (authors).

34520 (UCRL-JC–109884) **Electron cyclotron resonance heating in the microwave tokamak experiment.** Allen, S.L. (and others); Casper, T.A.; Fenstermacher, M.E. Lawrence Livermore National Lab., CA (United States). Sep 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920913–32: 14. international conference on plasma physics and controlled nuclear fusion research, Wurzburg (Germany), 30 Sep - 7 oct 1992; IAEA-CN–56/E-1-4). Order Number DE93018083. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results from a series of Electron Cyclotron Resonance Heating (ECRH) experiments on the Microwave Tokamak Experiment (MTX). On-axis heating at B_T = 5T (f_{ce} = 140 GHz) has been performed at electron densities up to cutoff. We have used both a long-pulse gryotron (~200 kW, ~0.1s) and a pulsed Free Electron Laser (FEL) as microwave sources. Gyrotron experiments with power densities corresponding to 4 MW m^{-3}. A far infrared (FIR) polarimeter measured peaking of plasma current profiles in some discharges during the ECRH pulse. During high-power single-pulse FEL experiments, single-pass microwave transmission measurements show nonlinear effects; i.e., higher transmission than predicted by linear theory. A corrugated-wall duct was used in the tokamak port to increase the gradient of the parallel refractive index $n_{parallel}$ of the incident wave, and increased absorption was observed. Evidence of electron tail heating during FEL pulses was observed on soft x-ray and ECE diagnostics. These results are in agreement with predictions of nonlinear theory; extrapolation of this theory to reactor-like conditions indicates efficient absorption and heating. A Laser Assisted Particle Probe Spectroscopy (LAPPS) diagnostic provided estimates of the vacuum electric field of the FEL which were consistent with the measured power. Multiple pulse operation of the ETA-II accelerator for the FEL has also been demonstrated, indicating the feasibility of high-average power FEL operation.

34521 (UCRL-JC–113165) **Time-resolved probing of electron thermal conduction in femtosecond-laser-pulse-produced plasmas.** Vue, B.T.V. (Lawrence Livermore National Lab., CA (United States)); Szoke, A.; Landen, O.L. Lawrence Livermore National Lab., CA (United States). Jun 1993. 6p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9304144–10: 2. international conference on laser ablation: mechanisms and applications, Knoxville, TN (United States), 19-22 Apr 1993). Order Number DE93016996. Source: OSTI; NTIS; INIS; GPO Dep.

We present time-resolved measurements of reflectivity, transmissivity and frequency shifts of probe light interacting with the rear of a disk-like plasma produced by irradiation of a transparent solid target with 0.1ps FWHM laser pulses at peak intensity 5×10^{14}W/CM^2. Experimental results show a large increase in reflection, revealing rapid formation of a steep gradient and overdense surface plasma layer during the first picosecond after irradiation. Frequency shifts due to a moving ionization created by thermal conduction into the solid target are recorded. Calculations using a nonlinear thermal heat wave model show good agreement with the measured frequency shifts, further confining the strong thermal transport effect.

34522 (UCRL-JC–113179) **Development of short pulse soft x-ray lasers.** Da Silva, L.B.; MacGowan, B.J.; Koch, J.A.; Mrowka, S.; Matthews, D.L.; Eder, D.; London, R. Lawrence Livermore National Lab., CA (United States). Feb 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–48: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93017150. Source: OSTI; NTIS; GPO Dep.

X-ray lasers with pulse duration shorter than 20 ps allow the possibility of imaging laser produced plasmas with μm resolution. In addition, the high peak brightness of these new sources will allow us to study nonlinear optics in the xuv region. In this paper we will describe our efforts to produce collisionally pumped short pulse x-ray lasers. Initial results, which have produced ~ 45 ps (FWHM) x-ray lasers, using a double pulse irradiation technique are presented along with a discussion of the prospects for reducing the pulse width.

34523 (UCRL-JC–113264) **Lower hybrid counter current drive for edge current density modification in DIII-D.** Fenstermacher, M.E. (Lawrence Livermore National Lab., CA (US)); Nevins, W.M.; Porkolab, M.; Bonoli, P.T.; Harvey, R.W. Lawrence Livermore National Lab., CA (United States); General Atomics, San Diego, CA (United States). Jul 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC03-89ER53277. (CONF-9304112–23: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93019157. Source: OSTI; NTIS; INIS; GPO Dep.

Each of the Advanced Tokamak operating modes in DIII-D is thought to have a distinctive current density profile. So far these modes have only been achieved transiently through experiments which ramp the plasma current and shape. Extension of these modes to steady state requires non-inductive current profile control, e.g. with lower hybrid current drive (LHCD). Calculations of LHCD have been done for DIII-D using the ACCOME and CQL3D codes, showing that counter driven current at the plasma edge can cancel some of the undesirable edge bootstrap current and potentially extend the VH-mode. Results are presented for scenarios using 2.45 GHz LH waves launched from both the midplane and off-axis ports. The sensitivity of the results to injected power, n_e and T_e, and launched wave spectrum is also shown.

34524 (UCRL-JC–113265) **Experiments on nonlinear absorption of ECH waves in MTX and a comparison with theory.** Stallard, B.W. (Lawrence Livermore National Lab., CA (US)); Allen, S.L.; Byers, J.A.; Casper, T.A.; Cohen, B.I.; Cohen, R.H.; Lasnier, C.J.; Fenstermacher, M.E.; Foote, J.H.; Hooper, E.B.; Makowski, M.A.; Meyer, W.H.; Moller, J.M.; Rice, B.W.; Roglien, T.DLawrence Livermore National Lab., CA (United States). Jul 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9304112–22: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93019158. Source: OSTI; NTIS; GPO Dep.

Intense pulse electron cyclotron heating (ECH) experiments have been carried out on the MTX tokamak. Rf pulses at 140 GHz, peak power of 1–2 GW, and 25 ns pulse length were generated by the ETA-II/IMP FEL and transported quasi-optically to MTX for o-mode launch. Because of the intense rf electric fields (~250 keV/cm), reduction of plasma absorption by nonlinear effects were expected and several rf beam geometries ($k_{||}$ gradient) were investigated to study their effect on the absorption. As predicted by theory, measurements of beam transmission showed increases compared to low power (2 kW). For these experiments x-ray, ECE, and Thomson diagnostics showed evidence for localized absorption at the cyclotron resonance and hot electron production. A comparison of these results with the orbit following code ORPAT is presented.

34525 (UCRL-LR–113062) **An experimental investigation of stimulated Brillouin scattering in laser-produced plasmas relevant to inertial confinement fusion.** Bradley, K.S. (Univ. of California, Davis, CA (US)). Lawrence Livermore National Lab., CA (United States). 11 Feb 1993. 206p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018067. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to University of California, Davis, CA (US).

Despite the apparent simplicity of controlled fusion, there are many phenomena which have prevented its achievement. One phenomenon is laser-plasma instabilities. An investigation of one such instability, stimulated Brillouin scattering (SBS), is reported here. SBS is a parametric process whereby an electromagnetic wave (the parent wave) decays into another electromagnetic wave and an ion acoustic wave (the daughter waves). SBS impedes controlled fusion since it can scatter much or all of the incident laser light, resulting in poor drive symmetry and inefficient laser-plasma coupling. It is widely believed that SBS becomes convectively unstable–that is, it grows as it traverses the plasma. Though it has yet to be definitively tested, convective theory is often invoked to explain experimental observations, even when one or more of the theory's assumptions are violated. In contrast, the experiments reported here not only obeyed the assumptions of the theory, but were also conducted in plasmas with peak densities well below quarter-critical density. This prevented other competing or coexisting phenomena from occurring, thereby providing clearly interpretable results. These are the first SBS experiments that were designed to be both a clear test of linear convective theory and pertinent to controlled fusion research. A crucial part of this series of experiments was the development of a new instrument, the Multiple Angle Time Resolving Spectrometer (MATRS). MATRS has the unique capability of both spectrally and temporally resolving absolute levels of scattered light at many angles simultaneously, and is the first of its kind used in laser-plasma experiments. A detailed comparison of the theoretical predictions and the experimental observations is made.

34526 (UCRL-LR–113984) **Behavior of the particle transport coefficients near the density limit in MTX.** Marinak, M.M. Lawrence Livermore National Lab., CA (United States). Apr 1993. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019108. Source: OSTI; NTIS; INIS; GPO Dep.

The perturbed particle transport coefficients were determined for a range of plasma conditions in the Alcator C tokamak, a component of the Microwave Tokamak Experiment (MTX), from analysis of density perturbations created in gas modulation experiments. Density measurements from a 15 chord far-infrared interferometer were sufficiently detailed to allow radial profiles of the transport coefficients to be resolved. Gas modulation experiments were carried out on plasmas over a range of relatively low currents and a wide variety of line-averaged densities, including values near the Greenwald density limit. With this technique the perturbed diffusion coefficient D and the perturbed convection velocity V can be determined simultaneously. Measured profiles of D rise toward the outside of the plasma column in a manner generally similar to those determined previously for $\chi_{e,HP}$ from sawtooth heat pulse propagation. Values of D are typically smaller than those of $\chi_{e,HP}$ given for the same line-averaged densities by a factor of 2-5. Diffusion coefficients from a series of discharges at constant current showed little variation with density through most of the saturated ohmic confinement regime. At the Greenwald density limit threshold a dramatic increase occurred in both the perturbed convective and diffusive transport coefficients in the outer region of the

plasma. The increases were most pronounced at the outermost range of the radii where coefficients were determined (r/a = 0.8), but were apparent over a region which extended well into the plasma interior. Density profiles maintained a similar shape near the density limit, congruous with the similar behavior of the transport coefficients. No dramatic deterioration was evident in the global energy confinement.

34527 (ANL/EP/CP–78902) **Thermal analysis of coatings and substrate materials during a disruption in fusion reactors.** Hassanein, A. Argonne National Lab., IL (United States). Jun 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930722–9: Annual meeting of the Society of Photo-Optical Instrumentation Engineers (SPIE), San Diego, CA (United States), 11-16 Jul 1993). Order Number DE93017688. Source: OSTI; NTIS; INIS; GPO Dep.

In a tokamak fusion reactor, the frequency of occurrence and the severity of a plasma disruption event will determine the lifetime of the plasma facing components. Disruptions are plasma instabilities which result in rapid loss of confinement and termination of plasma current Intense energy fluxes to components like the rust wall and the divertor plate are expected during the disruptions. This high energy deposition in short times may cause severe surface erosion of these components resulting from melting and vaporization. Coatings and tile materials are proposed to protect and maintain the integrity of the underneath, structural materials from both erosion losses as well as from high thermal stresses encountered during a disruption. The coating thickness should be large enough to withstand both erosion losses and to reduce the temperature rise in the substrate structural material. The coating thickness should be minimized to enhance the structural integrity, to reduce potential problems from radioactivity, and to minimize materials cost. Tile materials such as graphite and coating materials such as beryllium and tungsten on structural materials like copper, steel, and vanadium are analyzed and compared as potential diverter and first wall design options. The effect of the sprayed coating properties during the disruption is investigated. Porous sprayed material may be found to protect the structure better than condensed phase properties. The minimum coating thickness required to protect the structural material during disruption is discussed. The impact of self shielding effect by the eroded material oil the response of both the type/coating and the substrate is discussed.

34528 (BNL–52382) **A Draft Preconceptual design for a Spallation-Induced Lithium Conversion (SILC) target for the Accelerator Production of Tritium (APT).** Van Tuyle, G.J.; Cokinos, D.; Czajkowski, C.; Franz, E.; Kroeger, P.; Todosow, M.; Youngblood, R.; Zucker, M. Brookhaven National Lab., Upton, NY (United States). 22 Mar 1993. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93019776. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The draft preconceptual design of the APT Li-Al target system is summarized in this report. The system has been designed to produce a "3/8 Goal" quantity of tritium using the 200mA, 1.0-GeV proton beam emerging from the LANL-designed LINAC. The target system consists of a beam expander, a heavy-water-cooled lead spallation neutron source, a water-cooled Li-Al blanket, a target window, heat removal system, and related safety systems. Draft design descriptions are also provided for the target fabrication, tritium extraction, and waste-steam processes. Performance characteristics are presented and discussed.

34529 (CONF-930720–19) **The use of large surface area for particle and power deposition.** Seigneur, A. (Association Euratom-CEA, Centre d'Etude de Cadarache, 13 - Saint-Paul-lez-Durance (France)); Guihem, D.; Hogan, J.T. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. European conference on controlled fusion and plasma physics; Lisbon (Portugal); 26-30 Jul 1993. Order Number DE93018458. Source: OSTI; NTIS; INIS; GPO Dep.

Since the parallel heat flux passing through the LCFS has increased dramatically with the size of machines one has to cope with very large particle and power fluxes on the limiters. Thus the size of the limiters has been increased by the use of inner bumper limiters. The "exponential-sine" model is widely used to estimate the heat flux (Q) to a wall for a plasma flux surface with incident angle θ. The model predicts $Q = q_{||}(O) \sin\theta\, e^{-\rho/\lambda q} + q_{\perp}(O)\cos\theta e^{-\rho/\lambda q}$ ρ is the minor radius measured from the last closed flux surface (LCFS), λ_q is the SOL decay length of the heat, flux density and q(O) is the heat flux density at the last closed surface. If we approximate the heat flux as $Q = q_{||}\, e^{-\rho/\lambda q} \sin(\theta + \alpha)$, with $\alpha \equiv \tan^{-1}[q_{\perp}(0)/q_{||}(0)]$, than α can be interpreted as an effective "minimum angle of incidence". Under conditions where the geometric angle 0 has been made almost grazing the predictions of the simplest model is not adequate to represent the observation made in TORE-SUPRA; a similar result is found in TFTR. Experimental observations of heat and particle deposition on the large area limiter on the inner wall of TORE-SUPRA are presented. These results have been analyzed with a Monte Carlo code describing the diffusion of hydrogenic particles across the LCFS to the limiting objects in the Scrape Off Layer, and by impurity generation calculations using the full "exponential-sine" model used as input to an impurity Monte Carlo code.

34530 (DOE/DP/40200–204) **LLE review: Quarterly report, April–June 1992: Volume 51.** Short, R.W. (ed.). Rochester Univ., NY (United States). Lab. for Laser Energetics. [1992]. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC03-85DP40200. Order Number DE93018333. Source: OSTI; NTIS; GPO Dep.

This volume of the LLE Review, covering the period April–June 1992, contains articles on laser-plasma interaction experiments in long-scale-length plasmas and on the theory of a new form of the stimulated Brillouin scattering instabilitity. The advanced technology section includes reports on the optical response of superconducting films, the development of high-reflectance transport mirrors for the OMEGA Upgrade, and a new high-brightness mono-mode laser oscillator. Finally, the activities of the National Laser Users Facility and the GDL and OMEGA laser systems are summarized.

34531 (DOE/DP/40200–229) **LLE Review quarterly report, July–September 1992: Volume 52.** Short, R.W. (ed.). Rochester Univ., NY (United States). Lab. for Laser Energetics. [1992]. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC03-85DP40200. Order Number DE93018334. Source: OSTI; NTIS; GPO Dep.

This volume of the LLE Review, covering the period July–September 1992, contains articles on methods of balancing the beam power on the OMEGA Upgrade and on the damping of ion-sound waves in laser-produced plasmas. The advanced technology section includes reports on optical nonlinearities in high-temperature superconductors, a method of increasing gas retention time for laser-fusion targets, and a study of stimulated Raman scattering of laser beams in air. Highlights of the research reported in this issue are: An efficient method has been developed for balancing the power in the 60 beams of the OMEGA Upgrade. The method can achieve 2% power balance for both main and foot beams using only four system shots. A study of ion-sound-wave damping has substantially revised and expanded our knowledge of this effect. The damping of ion waves can have important consequences for laser-plasma interaction. The use of femtosecond laser pulses to study the properties of thin-film, high-temperature superconductors is discussed. A method for increasing the gas retention time of polymer-shell laser-fusion targets by overcoating them with a thin layer of aluminum is described. A code has been developed to study stimulated rotational Raman scattering in high-power laser beams propagating through air.

34532 (DOE/DP/40200–245) **LLE Review quarterly report, October–December 1992: Volume 53.** Meyerhofer, D.D. (ed.). Rochester Univ., NY (United States). Lab. for Laser Energetics. [1992]. 65p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract FC03-85DP40200. Order Number DE93018335. Source: OSTI; NTIS; GPO Dep.

This volume of the LLE Review covers the three-month period October–December 1992. On 18 December, the OMEGA Laser Facility fired its last shot. It will be decommissioned during the next quarter to make room for the OMEGA Upgrade Laser Facility. This volume deals with two areas of interest for the OMEGA Upgrade, the development of advanced x-ray and neutron diagnostics and the development of long-pulse (>1-ns) laser sources. The first three articles discuss the development of time-dependent diagnostics. The development of an x-ray framing camera is described and measurements of the high-voltage pulse propagation in the camera are presented. Time-resolved and time-integrated neutron diagnostics for the OMEGA Upgrade are then discussed. Two schemes for the generation of >1-ns laser pulses are presented. Finally, the activities of the National Laser Users Facility and the GDL and OMEGA laser facilities are summarized.

34533 (DOE/DP/40200–251) **LLE Review quarterly report, January–March 1993: Volume 54.** Meyerhofer, D.D. (ed.). Rochester Univ., NY (United States). Lab. for Laser Energetics. [1993]. 25p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FC03-92SF19460 ;FC03-85DP40200. Contract PHY-9200542. Order Number DE93017618. Source: OSTI; NTIS; GPO Dep.

This volume of the LLE Review covers the three-month period January–March 1993. The OMEGA laser facility was decommissioned during this quarter to make room for the OMEGA Upgrade laser facility. The decommissioning is described in this volume. Electron thermal transport in the corona and laser-irradiation uniformity are related issues for direct-drive laser fusion. Thermal transport can affect the laser-irradiation uniformity requirements. The status of Fokker-Planck modeling of electron transport at LLE is reviewed and is followed by a description of a new technique for achieving high laser uniformity using zero-correlation phase masks. The use of fast, optically triggered, superconducting opening switches can, in principle, reduce the peak electrical load requirements of systems like the OMEGA Upgrade. Recent research in this area is described. The last three articles discuss vacuum ultraviolet and x-ray emission from short-pulse, laser-matter interactions. The generation of a high spectral brightness, picosecond Kα source is described. The subsequent articles describe the generation of high-order harmonics of a high-intensity laser system laser system in low- density, laser-atom interactions and the novel gas target used.

34534 (DOE/ER–0313/13, pp. 3-4) **Beam-target interaction in an accelerator-based neutron source for a fusion material test facility.** Hassanein, A.; Smith, D. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

High-current linear-accelerators have increased the attractiveness of a deuterium-lithium neutron source for fusion materials testing and evaluation. Detailed beam-target interaction and the resulting energy deposited and the jet thermal response are analyzed. Issues relating to jet instabilities, nozzle erosion rates, and the impact of thicker jets on the neutron spectrum at the testing area need further analysis.

34535 (DOE/ER–0313/13, pp. 5-6) **Liquid lithium target development for an accelerator-based neutron source.** Picologlou, B.F.; Smith, D.L. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

A proposed high-flux high energy fusion materials irradiation facility uses a deuteron beam impinging on a lithium target to produce neutrons with a spectrum that peaks around 14 MeV. The lithium target consists of a jet of liquid lithium of appropriate thickness. The lithium target development activity is examining the possibility of creating a stable planar free jet of desirable thermal hydraulic characteristics through magnetohydrodynamic body forces created by a DC magnetic field.

34536 (DOE/ER–0313/13, pp. 7-8) **Conceptual designs of superconducting accelerators for a Fusion Materials Irradiation Facility.** Clare, R.B.; Delayen, J.R.; Micklich, B.J. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

This research has been of a theoretical and analytical nature. The dynamics of high-current beams have been investigated, with the goal of identifying possible instabilities and their cures, and also the causes of emittance growth and halo formation which would lead to activation of the accelerator. Conceptual designs of some of the critical components of the accelerator have been made, and a model has been developed for the control and stabilization of heavily beam loaded superconducting cavities.

34537 (DOE/ER–0313/13, pp. 9-11) **Neutronics analysis of a D-Li neutron source.** Gomes, I.; Gohar, Y.; Smith, D. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Results from preliminary calculations for one beam and dual beam deuterium beam configurations are presented. The influence of the lithium target thickness on the neutron economy of the system has been addressed. The nuclear responses induced by the neutron source has been calculated and a brief discussion about the lack of evaluated nuclear cross section data above 20 MeV is presented.

34538 (DOE/ER–0313/13, pp. 12-20) **The influence of specimen size on measurement of thermal or irradiation creep in pressurized tubes.** Garner, F.A. (Pacific Northwest Laboratory, Richland, VA (US)); Hamilton, M.L.; Kumar, A.S.; Puigh, R.J.; Elholzer, C.R.; Duncan, D.R.; Toloczko, M.B. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Thin-walled pressurized tubes have been developed for measurement of thermal creep and irradiation creep. Miniaturization of these tubes allows more tests to be conducted in the limited reactor space available and decreases the impact of displacement rate gradients and temperature gradients. Studies conducted on a variety of tube sizes show that, when specimen fabrication history and irradiation conditions are controlled, miniaturization can be successfully achieved and valid data produced.

34539 (DOE/ER–0313/13, pp. 21-22) **Status of US/Japan collaborative program phase II HFIR target capsules.** Pawel, J.E. (Oak Ridge National Lab., TN (US)); Senn, R.L. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

A complete description and details of the design, construction, and installation of capsules JP-9 through JP-16 has been previously reported. The capsules were installed in the High Flux Isotope Reactor (HFIR) target July 20, 1990 for irradiation beginning with HFIR fuel cycle 289. The capsules were removed and stored in the reactor pool during HFIR cycle 292 (11/25/90 - 12/10/90) to provide room for required isotope production. They were reinstalled for HFIR cycle 293 for continued irradiation. Of these eight target capsules, JP-10, 11, 13, and 16 completed their scheduled number of cycles (11) and were removed from the reactor in September 1991. In addition, JP-14 was removed from the reactor at the end of cycle 310 (9/18/92) after 21 cycles. Three new capsules in this series, JP-20, 21, and 22, are currently being designed. These capsules were added to the program in order to complete the experimental matrix included in the JP-9 through JP-16 capsules. The new capsules will contain transmission electron microscope (TEM) disks and SS-3 flat tensile specimens at 300-600°C and will achieve doses of 8, 18 and 40 dpa, respectively. The preliminary experiment matrix is described in detail in a previous report.

34540 (DOE/ER–0313/13, pp. 23-25) **Fabrication and operation of HFIR-MFE RB spectrally tailored irradiation capsules.** Longest, A.W. (Oak Ridge National Lab., TN (US)); Heatherly, D.W.; Clemmer, E.D. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The objective of this work is to fabricate and operate irradiation capsules for irradiating magnetic fusion energy (MFE) candidate first-wall materials in the High Flux Isotope Reactor (HFIR) removable beryllium (RB*) positions. Japanese and US MFE specimens are being transferred to RB* positions following irradiation to 7.5 dpa at temperatures of 60, 200, 330, and 400°C in Oak Ridge Research Reactor (ORR) experiments ORR-MFE-6J and -7J. Fabrication and operation of four HFIR-MFE RB* capsules (60, 200, 330, and 400°C) to accommodate MFE specimens previously irradiated in spectrally tailored experiments in the ORR are proceeding satisfactorily. With the exception of the 60°C capsule, where the test specimens are in direct contact with the reactor cooling water, specimen temperatures (monitored by 21 thermocouples) are controlled by varying the thermal conductance of a thin gas gap region between the specimen holder outer sleeve and containment tube. Irradiation of the 60 and 330°C capsules was started on July 17, 1990. As of September 30, 1992, these two capsules had completed 22 cycles of their planned 24-cycle (formerly 22-cycle) irradiation to a damage level of approximately 18.3 displacements per atom (dpa). Assembly of the 200 and 400°C capsules is scheduled for completion in November 1992; operation of these two capsules will follow the first two (60 and 330°C).

34541 (DOE/ER–0313/13, pp. 29-41) **Neutron displacement damage cross-sections for SiC.** Huang, H. (Univ. of California, Los Angeles (US)); Ghoniem, N. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The objective of the present study is to develop and apply a computational tool for calculations of neutron displacement cross-sections for SiC in various fission and fusion neutron spectra. Calculations of neutron displacement damage cross-sections for SiC are presented. Biersack and Haggmark's empirical formula is used in constructing the electronic stopping power, which combines the Lindhard's model at low PKA energies and the Bethe-Bloch's model at high PKA energies. The electronic stopping power for polyatomic materials is computed on the basis of Bragg's Additivity Rule. A continuous form of the inverse power law potential is used for nuclear scattering. Coupled intergro- differential equations for the number of displaced atoms j, caused by PKA i, are then derived. The procedure outlined above gives partial displacement cross-sections, displacement cross-sections for each species of the lattice, and for each PKA type. The corresponding damage rates for several fusion and fission neutron spectra are calculated. The stoichiometry of the irradiated material is investigated by finding the ratio of displacements among various atomic species. The role of each specie in displacing atoms is also investigated by calculating the fraction of displacements caused by each PKA type. The study shows that neutron displacement damage rates of SiC in typical magnetic fusion reactor first walls will be ~10-15 $[dpa][MW]^{-1}[m]^2$, that in typical lead-protected inertial confinement fusion reactor first walls to be ~15-20 $[dpa][MW]^{-1}[m]^2$. For fission spectra, the neutron displacement damage rate of SiC is ~74[dpa]per 10^{27}n/m^2 in FFTF, ~39[dpa]per 10^{27} in HFIR, and 25 [dpa] per 10^{27} in NRU. Approximately 80% of displacement atoms are shown to be of the carbon-type.

34542 (DOE/ER–0313/13, pp. 42-47) **Transmutation of copper in FFTF and starfire.** Garner, F.A. (Pacific Northwest Lab., Richland, VA (US)); Greenwood, L.R.; Mann, F.M. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Calculations of the transmutation of pure copper in the recent MOTA-2A out-of-core experiment yield somewhat different values than expected from previous calculations for earlier MOTA in-core experiments. The differences arise not only from position-dependent spectral variations but also from changes in neutron flux and spectrum associated with the placement of the CDE experiment in FFTF. In addition, there has been a re-evaluation of the cross-sections for transmutation. The resulting differences between the current and earlier predictions for the original FFTF core loading are that the zinc concentration is significantly higher and the nickel concentration is somewhat lower in the current calculation. Relative to the original core loading, however, the production rate per dpa of both nickel and zinc in the MOTA-2A experiment in the current core loading is increased due to spectral softening arising from both the new CDE core and the out-of-core location. Although the nickel transmutation rate increases significantly in the STARFIRE first wall neutron spectrum, the nickel-to-zinc transmutation ratio is also reduced compared to that of previous calculations, with the difference arising only from the re-evaluation of the transmutation cross-sections.

34543 (DOE/ER–0313/13, pp. 55-73) **Analysis of displacement damage and defect production under cascade damage conditions.** Zinkle, S.J. (Oak Ridge National Lab., TN (US)); Singh, B.N. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC05-84OR21400. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The production, annihilation, and accumulation of point defects in metals during displacive irradiation is dependent on a variety of physical conditions, including the nature and energy of the projectile particles and the irradiation temperature. This paper briefly reviews the evolution of the defect population in an isolated displacement cascade, and outlines a proposed framework for identifying the relevant components of displacement damage and defect production under cascade damage conditions. The most significant aspect of energetic cascades is that the concepts of atomic displacements and residual defect production must be treated separately. An evaluation of experimental and computer defect production studies indicates that the overall fraction of defects surviving correlated annihilation in the displacement cascade in copper decreases from about 30% of the Norgett-Robinson-Torrens (NRT) calculated displacements at 4 K to about 10% of the NRT displacements at 300 K. Due to differences in the thermal stability of vacancy versus interstitial clusters, the fractions of freely migrating defects available for inducing microstructural changes at elevated temperatures may be higher for vacancies than for interstitials. The available evidence suggests that the fraction of freely migrating vacancies at temperatures relevant for void swelling in copper is ~5% of the calculated NRT displacements.

34544 (DOE/ER–0313/13, pp. 74-78) **The relationship between the collisional phase defect distribution and cascade collapse efficiency.** Morishita, K. (Univ. of Tokyo (JP)); Ishino, S.; Heinisch, H.L. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Cascades produced in binary collision simulations of ion-irradiation experiments were analyzed to determine if a correlation exists between the defect distribution in the collisional phase and the number of visible clusters produced directly in cascades (caused by the so-called "collapse" of the cascade defects). The densities of the vacancy distributions in the simulated cascades were compared to the measured cascade collapse efficiencies to obtain the minimum or "critical" vacancy densities required for collapse. The critical densities are independent of the cascade energy for self-ions and exhibit differences with ion mass that are consistent with the cascade energy dissipation characteristics.

34545 (DOE/ER–0313/13, pp. 79-92) **Effects of stress on microstructural evolution during irradiation.** Gelles, D.S. (Pacific Northwest Lab., Richland, VA (US)). Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress*

report for period ending September 30, 1992. 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Many theories have been postulated to describe irradiation creep but few have been supported with microstructural evidence. The purpose of this paper is to review microstructural studies of the effects of stress during irradiation in order to assess the validity of the available irradiation creep theories. Microstructural studies based on high voltage electron, ion, proton and neutron irradiation will be described, with major emphasis placed on interpreting behavior demonstrated in austenitic steels. Special attention will be given to work on fast neutron irradiated Nimonic PE16, a precipitation strengthened superalloy.

34546 (DOE/ER–0313/13, pp. 93-100) **Irradiation creep due to SIPA under cascade damage conditions.** Woo, C.H. (Pacific Northwest Lab., Richland, VA (US)); Garner, F.A.; Holt, R.A. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

This paper derives the relationships between void swelling and irradiation creep due to Stress-Induced Preferred Absorption (SIPA) and SIPA-Induced Growth (SIG) under cascade damage conditions in an irradiated pressurized tube. It is found that at low swelling rates irradiation creep is a major contribution to the total diametral strain rate of the tube, whereas at high swelling rates the creep becomes a minor contribution. The anisotropy of the corresponding dislocation structure is also predicted to decline as the swelling rate increases. The theoretical predictions are found to agree very well with experimental results.

34547 (DOE/ER–0313/13, pp. 101-106) **Simulating high energy cascades in metals.** Heinisch, H.L. (Pacific Northwest Laboratory, Richland, VA (US)). Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The processes of radiation damage, from initial defect production to microstructure evolution, occur over a wide spectrum of time and size scales. An understanding of the fundamental aspects of these processes requires a spectrum of theoretical models, each applicable in its own time and distance scales. As elements of this multi-model approach, molecular dynamics and binary collision simulations play complementary roles in the characterization of the primary damage state of high energy collision cascades. Molecular dynamics is needed to describe the individual point defects in the primary damage state with the requisite physical reality. The binary collision approximation is needed to model the gross structure of statistically significant numbers of high energy cascades. Information provided by both models is needed for connecting the defect production in the primary damage state with the appropriate models of defect diffusion and interaction describing the microstructure evolution. Results of binary collision simulations of high energy cascade morphology are reviewed. The energy dependence of freely migrating defect fractions calculated in recent molecular dynamics simulations are compared to results obtained much earlier with a binary collision/annealing simulation approach. The favorable agreement demonstrates the viability of the multi-model approach to defect production in high energy cascades.

34548 (DOE/ER–0313/13, pp. 107-108) **Swelling of pure nickel observed in the second discharge of the AA-14 experiment.** Garner, F.A. (Pacific Northwest Lab., Richland, VA (US)). Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The swelling of neutron-irradiated pure nickel is strongly dependent on its tendency toward saturation. The factors which induce saturation also lead to a strong dependence on irradiation temperature for nickel in the annealed condition. When irradiated in the cold-worked condition, however, the temperature dependence of swelling is strongly reduced but the tendency toward saturation persists.

34549 (DOE/ER–0313/13, pp. 109-114) **Completion of the ORR/MFE-4 experiment involving high rates of helium generation in Fe-Cr-Ni alloys.** Sekimura, N. (Univ. of Tokyo (JP)); Garner, F.A. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Completion of the microscopy examination of the ORR/MFE-4 experiment confirms the conclusions reached earlier in this study. Helium generated at very high levels (~30 to 60 appm/dpa) does indeed strongly influence the microstructural evolution of Fe-Cr-Ni austenitic alloys, especially when the temperature history involves a large number of low temperature excursions. Under these conditions the effect of composition and starting condition are relatively unimportant.

34550 (DOE/ER–0313/13, pp. 115-117) **^{59}Ni isotopic tailoring experiment: Results of tensile test on MOTA-1G specimens.** Hamilton, M.L. (Pacific Northwest Lab., Richland, VA (US)); Garner, F.A. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Tensile tests have been conducted on the last two groups of isotopic tailoring specimens discharged from MOTA-1G. The results agree with those reported earlier, showing a very small impact of fusion-relevant helium/dpa levels on neutron-induced changes in tensile properties of three model austenitic alloys.

34551 (DOE/ER–0313/13, pp. 118-130) **Microstructural evolution in irradiatd Fe-Cr-M alloys: Solute effects.** Gelles, D.S. (Pacific Northwest Laboratory, Richland, VA (US)). Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

A series of alloys based on Fe-10Cr with solute additions of silicon, vanadium, manganese, tungsten, tantalum, and zirconium at 0.1 and 1.0% levels, has been examined by transmission electron microscopy following fast neutron irradiation. Marked differences in dislocation evolution and void shape following neutron irradiation were found as a function of alloying. The present study extends previous examinations by investigating microstructural response following irradiation at a lower temperature (365°C) to 30 dpa and to a higher dose, 100 dpa, at 410°C. Swelling level, void shape, and dislocation configuration continued to vary as a function of the various solutes present in the same manner as seen previously. However, two additional observations were made. Irradiation at the lower temperature promotes precipitation of chromium rich α' phase and reduces microstructural evolution. Also, irradiation to higher dose, reduces the effect each solute exerts by lessening the wide variation in void shape and dislocation evolution that were found at lower dose.

34552 (DOE/ER–0313/13, pp. 131-137) **Postirradiation deformation behavior in ferritic Fe-Cr alloys.** Hamilton, M.L. (Pacific Northwest Lab., Richland, VA (US)); Gelles, D.S.; Gardner, P.L. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

It has been demonstrated that fast neutron irradiation produces significant hardening in simple Fe(3-18)Cr binary alloys irradiated to about 35 dpa in the temperature range 365 to 420°C, whereas irradiation at 574°C produces hardening only for 15% or more chromium. The irradiation-induced changes in tensile properties are discussed in terms of changes in the power law work hardening exponent. The work hardening exponent of the lower chromium alloys decreased significantly after low temperature irradiation ($\leq$420°C) but increased after irradiation at 574°C. The higher chromium alloys failed either in cleavage or in a mixed ductile/brittle fashion. Deformation microstructures are presented to support the tensile behavior.

34553 (DOE/ER–0313/13, pp. 141-150) **Charpy impact toughness of martensitic steels irradiated in FFTF: Effect of heat treatment.** Klueh, R.L. (Oak Ridge National Lab., TN (US)); Alexander, D.J. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Plates of 9Cr-1MoVNb and 12Cr-1 MoVW steels were normalized and then tempered at two different tempering conditions. One-third-size Charpy specimens from each steel were irradiated to 7.4-8$\times 10^{26}$ n/m^2 (about ~35 dpa) at 420°C in the Materials Open Test Assembly (MOTA) of the Fast Flux Test Facility. Specimens were also thermally aged to 20,000 h at 400°C to compare the effect of aging and irradiation. Previous work on the steels irradiated to 4-5 dpa at 365°C in MOTA were reexamined in light of the new results. The tests indicated that prior-austenite grain size, which was varied by different normalizing treatments, had an effect on impact behavior of the 9Cr-1MoVNb but not on the 12Cr-1MoVW. Tempering treatment had relatively little effect on the shift in DBTT for both steels. Conclusions are presented on how heat treatment can be used to optimize properties.

34554 (DOE/ER–0313/13, pp. 151-156) **Relationship of bainitic microstructure to impact toughness in Cr-Mo and Cr-W steels.** Klueh, R.L. (Oak Ridge National Lab., TN (US)); Alexander, D.J. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Non-classical bainite microstructures can develop during continuous cooling of low-carbon alloy steels. These differ from classical upper and lower bainite developed by isothermal transformation. Two non-classical bainite microstructures were produced in a 3Cr-1.5Mo-0.25V-0.1C steel using different cooling rates after austenitizing–water quenching and air cooling. The carbide-free acicular bainite formed in the quenched steel had a lower ductile-brittle transition temperature (DBTT) than the granular bainite formed in the air-cooled steel. With increasing tempering parameter, the DBTT of both decreased and approached a common value, although the final value occurred at a much lower tempering parameter for the quenched steel than for the air-cooled steel. The upper-shelf energy was similarly affected by microstructure. These observations along with similar observations in two Cr-W steels indicate that control of the bainite microstructure can be used to optimize strength and toughness.

34555 (DOE/ER–0313/13, pp. 157-167) **Reduced activation ferritic alloys for fusion.** Gelles, D.S. (Pacific Northwest Lab., Richland, VA (US)). Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Reduced activation martensitic alloys can now be developed with properties similar to commercial counterparts, and oxide dispersion strengthened alloys are under consideration. However, low chromium Bainitic alloys with vanadium additions undergo severe irradiation hardening at low irradiation temperatures and excessive softening at high temperatures, resulting in a very restricted application window. Manganese additions result in excessive embrittlement, as demonstrated by post-irradiation Charpy impact testing. The best composition range for martensitic alloys appears to be 7 to 9 Cr and 2 W, with swelling of minor concern and low temperature irradiation embrittlement perhaps eliminated. Therefore, reduced activation martensitic steels in the 7 to 9 Cr range should be considered leading contenders for structural materials applications in power-producing fusion machines.

34556 (DOE/ER–0313/13, pp. 168-173) **Mechanical properties of martensitic alloy AISI 422.** Hamilton, M.L. (Pacific Northwest Lab., Richland, VA (US)); Huang, F.H.; Hu, W. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

HT9 is a martensitic stainless steel that has been considered for structural applications in liquid metal reactors (LMRs) as well as in fusion reactors. AISI 422 is a commercially available martensitic stainless steel that closely resembles HT9, and was studied briefly under the auspices of the US LMR program. Previously unpublished tensile, fracture toughness and charpy impact data on AISI 422 were reexamined for potential insights into the consequences of the compositional differences between the two alloys, particularly with respect to current questions concerning the origin of the radiation-induced embrittlement observed in HT9.

34557 (DOE/ER–0313/13, pp. 179-181) **Status of the dynamic helium charging experiment (DHCE).** Loomis, B.A. (Pacific Northwest Lab., Richland, VA (US)); Smith, D.L.; Hamilton, M.L.; Greenwood, L.R.; Clemmer, R.G.; Matsui, H.; Pearce, K.L.; Kopasz, J.P.; Johnson, C.E. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The objective of this experiment is to provide baseline irradiation data on the effects of concurrent helium production and neutron irradiation on the physical and mechanical properties of vanadium alloys. Effects of helium production and irradiation on the alloy microstructures will also be characterized. This report summarizes the status of the DHCE in FFTF-MOTA, the preparations for retrieval of specimens from the irradiation capsules, and experimental results on procedures for the removal of tritium from the irradiated specimens.

34558 (DOE/ER–0313/13, pp. 182-186) **Hydrogen embrittlement of niobium-base alloys for application in the ITER divertor.** Peterson, D.T.; Hull, A.B.; Loomis, B.A. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The corrosion rate of Nb alloys in high-purity water was demonstrated to be quite low at 300°C and only a fraction of the hydrogen (H) produced by corrosion was absorbed. The calculated H concentrations in an ITER divertor plate are below levels expected to cause embrittlement. Corrosion, H absorption, and resistance to embrittlement of Nb can be significantly improved by alloying. Alloying of Nb can increase the terminal solid solubility of H in Nb-V alloys. Consequently, alloying Nb with V reduces the embrittlement caused by H. Hence, there appear to be good prospects for increasing the solubility of the hydride phase and of increasing the tolerance for H by developing appropriate Nb alloys. Thermotransport of H may perturb H concentration and thus needs further evaluation.

34559 (DOE/ER–0313/13, pp. 187-193) **Tensile properties of vanadium-base alloys with a tungsten/inert-gas weld zone.** Loomis, B.A.; Konicek, C.F.; Nowicki, L.J.; Smith, D.L. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The tensile properties of V-(0-20)Ti and V-(O-15)Cr-5Ti alloys after butt-joining by tungsten/inert-gas (TIG) welding were determined from tests at 25°C. Tensile tests were conducted on both annealed and cold-worked materials with a TIG weld zone. The tensile properties of these materials were strongly influenced by the microstructure in the heat-affected zone adjacent to the weld zone and by the intrinsic fracture toughness of the alloys. TIG weld zones in these vanadium-base alloys had tensile properties comparable to those of recrystallized alloys without a weld zone. Least affected by the TIG welding were tensile properties of the V-5Ti and V-5Cr-5Ti alloys. Although the tensile properties of the V-5Ti and V- 5Cr-5Ti alloys with a TIG weld zone were acceptable for structural material, these properties would be improved by optimization of the welding parameters for minimum grain size in the heat-affected zone.

34560 (DOE/ER–0313/13, pp. 194-202) **Effects of irradiation-induced precipitation on properties of vanadium alloys.** Chung, H.M. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Two major and two minor types of irradiation-induced precipitates were identified in V-Ti, V-Cr-Ti, and V-Ti-Si alloys after neutron irradiation in the Fast Flux Test Facility (FFTF) at 420 and 600°C to fluences up to 114 dpa. The major precipitates are Ti_5Si_3 and Ti_2O phases. Effects of irradiation temperature and dose on the two major types of precipitation were examined after irradiation at 420, 600, and 600°C plus an excursion to 850°C for 50 min. Precipitation of the very fine Ti_5Si_3 particles at 420°C increases monotonically with increasing dose, whereas at 600°C the maximum precipitation occurs at ~20-40 dpa. The characteristic precipitation kinetics were consistent with swelling and elongation behavior observed for the low and high irradiation temperatures. For operation at 420°C, it is important to optimize the Si level and ensure sufficient Ti "in solution" (i.e., Ti solutes not bound to thermal precipitates), and thereby optimizing the precipitation of Ti_5Si_3. For operation at 600°C, minimizing the O content, in addition to Si and Ti control, is important in minimizing Ti_2O precipitation.

34561 (DOE/ER–0313/13, pp. 203-213) **Preliminary assessment of candidate niobium alloys for divertor structures.** Todd, J.A.; Purdy, I.M. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Corrosion rates of several Nb-base alloys that contain ~2.5 at. % Zr, V, Hf, Ti, Ta, Mo, or W were determined in HP deoxygenated water at 300°C. Microstructural characteristics of the corrosion-product layers were examined by optical and scanning electron microscopy (SEM). Although the weight-gain corrosion rates were not excessive and only a fraction (<20%) of the hydrogen liberated by the overall corrosion reaction was absorbed by the alloys, most of the alloys were deemed to be brittle, i.e., fracture occurred during a 90° bend test. The microstructural evaluations revealed numerous cracks and spalling of the oxide layers; this is characteristic of nonprotective film formation. Some of the crack surfaces in the alloys were covered by corrosion product, indicating that the cracks formed during exposure to high-temperature water. The present results suggest that Nb alloys with higher concentrations of alloying elements are required to improve the protective nature of the corrosion-product layers and to decrease hydrogen uptake and embrittlement. Procurement of candidate alloys is in progress and corrosion/H_2-embrittlement tests will be conducted at lower temperatures to determine material operating conditions that will lead to adequate performance of alloys as structural materials in the ITER divertor.

34562 (DOE/ER–0313/13, pp. 214-216) **Creep of V-5Cr-5Ti and V-10Cr-5Ti alloys at 600°C.** Loomis, B.A.; Nowicki, L.J.; Smith, D.L. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The objective of this research is to determine the composition of a vanadium base alloy with the optimal combination of mechanical properties, corrosion resistance, fabricability, and weldability for use as a structural material in the environment of a magnetic fusion reactor. Creep tests were conducted on V-5Cr-5Ti and V-10Cr-5Ti alloys at 600°C. The results of these tests show that the V-10Cr-5Ti alloy has significantly higher creep strength than the V-5Cr-5Ti alloy.

34563 (DOE/ER–0313/13, pp. 217-221) **Relationship of hardness and tensile strength of vanadium and vanadium-base alloys.** Loomis, B.A.; Gazda, J.; Nowicki, L.J.; Smith, D.L. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The Vickers hardness numbers (VHNs) of annealed and recrystallized vanadium and V-(0-15)Cr-(0-5)Ti-(0-1)Si alloys were determined at 25°C. The relationship between the VHN and the tensile strength of these materials previously reported by Loomis et al. are presented in this report. These results show that the VHN, yield strength (YS), and ultimate tensile strength (UTS) of V-(0-15)Cr-5Ti alloys at 25°C have a similar dependence on Cr concentration and that the VHN, YS, and UTS of V-(0-20)Ti alloys at 25°C have a similar dependence on Ti concentration. On the basis of these results and the small size of the test specimen, it is recommended that the Vickers hardness test be utilized in the vanadium alloy development program to determine the effects of thermal-mechanical treatment, impurities (i.e., O, N, C, H, and Si), and irradiation on tensile properties of vanadium-base alloys.

34564 (DOE/ER–0313/13, pp. 222-226) **Correlation of microstructure and mechanical properties of vanadium-base alloys.** Gazda, J. (Univ. of Illinois, Chicago (US)); Danyluk, S.; Loomis, B.A.; Smith, D.L. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The mechanical properties and microstructure of V, V-3Ti-1Si, and V-5Ti alloys were investigated by microhardness testing, optical microscopy, and transmission electron microscopy (TEM). The microhardness data were related to tensile test data reported by Loomis et al. The microhardness and tensile strength of these materials were related to the number density of precipitates. The most common precipitates were identified as: V_6O_{13} and VS_4 for vanadium; Ti(C,N,O) and various forms of Ti-S for V-3Ti-1Si; Ti(C,N,O) and TiN for V-5Ti. The crystallographic lattice parameters for these alloys were determined by X-ray diffraction.

34565 (DOE/ER–0313/13, pp. 227-234) **Effects of impurities and doping elements on phase structure of vanadium-base alloys containing titanium.** Satou, M.; Chung, H.M. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The thermal phase structure of vanadium-base alloys that contain Ti is strongly influenced by impurities. When the combined concentration of O, N, and C is >500 wt. ppm, Ti solutes form blocky Ti(O,N,C) precipitates during fabrication. When the O+N+C level is 400 wt. ppm, the Ti(O,N,C) phase is absent. With Si and Y in the alloy, Ti solutes form Ti_5Si_3 and $(Y,Si_{1-x})_2O_3$ precipitates. A low impurity concentration and Y doping promote preservation of Ti atoms in solution. Swelling of V-5Cr-5Ti specimens doped with Si, Y, and Al was low after irradiation at 406 and 600°C. The excellent resistance to swelling is attributed to dense distribution of ultrafine Ti_5Si_3 and Y_2O_3 like precipitates that are formed during irradiation and provide a large number of sinks for vacancies; and hence, they effectively suppress nucleation of voids during irradiation.

34566 (DOE/ER–0313/13, pp. 235-237) **Influence of boron-generated helium on the swelling of neutron-irradiated pure vanadium and vanadium-5% chromium.** Sekimura, N. (Univ. of Tokyo (JP)); Garner, F.A. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

In agreement with earlier reports, the addition of five weight percent chromium to pure vanadium leads to a significant increase in neutron-induced void swelling at 600°C. Although the swelling of V-5Cr increases strongly with irradiation temperature, the influence of chromium is reversed at lower temperatures, with pure vanadium swelling more than V-5Cr. The use of boron additions to generate large amounts of helium in V and V-5Cr leads to a very complex swelling response, depending on boron level, chromium level and irradiation temperature. The most pronounced response occurs in V-5Cr at 600°C, where boron levels of 100 appm or greater cause a significant reduction in swelling. The complexity of swelling response is thought to result from the competition between helium effects and the separate chemical effects of boron and

lithium, each of which may exhibit its own dependence on irradiation temperature.

34567 (DOE/ER–0313/13, pp. 238-249) **Compatibility of vanadium alloys with reactor-grade helium for fusion reactor.** Bell, G.E.C. (Oak Ridge National Lab., TN (US)); Bishop, P.S. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Miniature tensile specimens of V-5Cr-5Ti, V-10Cr-5Ti, and V-12.5Cr-5 Ti were exposed in a once-through system to helium with 70 vppm-H_2 (measured oxygen partial pressures of 10^{-12} atm) and bottle helium (measured oxygen partial pressures of 10^{-4} atm) between 500 and 700°C for up to 1008 h. The weight changes in the specimens were recorded. The helium-exposed specimens were tensile tested, and the effects of exposure on mechanical properties were assessed. Exposure between 500 and 700°C for 1008 h in He+70 vppm-H_2 resulted in complete embrittlement of all the alloys in room temperature tensile tests. The fracture mode was primarily cleavage, probably caused by a hydrogen-induced shift in the ductile to brittle transition temperature (DBTT). Weight gains increased with temperature and were largest for the V-5Cr-5Ti alloy. Specimens exposed for 531 h between 500 and 700°C in bottle He exhibited two distinct fracture morphologies on the fracture surfaces. Brittle cleavage around the edges of the specimens gave way to ductile dimpling in the center of the specimens. The brittle region around the periphery of the specimen is most likely the higher vanadium oxide, V_2O_5.

34568 (DOE/ER–0313/13, pp. 253-254) **Swelling of copper alloys irradiated in MOTA 2A.** Garner, F.A. (Pacific Northwest Lab., Richland, VA (US)); Edwards, D.J.; Singh, B.N.; Watanabe, H. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Density measurements have been completed on copper alloys irradiated in MOTA 2A at (375°C, 12.7 dpa) and (423°C, 48.0 dpa). While most of the density changes observed are consistent with those of earlier studies, there were several surprises. The role of cold work on swelling of Cu-5Ni is relatively small and Cu-5Mn does not appear to swell at all.

34569 (DOE/ER–0313/13, pp. 255-257) **Cobra-1A copper irradiation experiment in EBR-II.** Garner, F.A (Pacific Northwest Lab., Richland, VA (US)); Hamilton, M.L.,. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The objective of this effort is to provide data on the radiation response of copper alloys selected as candidates for divertor service in ITER and other fusion devices. Specimen preparation for copper alloys to be irradiated in EBR-II Run 162 in the COBRA irradiation vehicle is complete. Specimens include TEM disks, miniature tensile and miniature fatigue specimens.

34570 (DOE/ER–0313/13, pp. 258-264) **The influence of transmutation and void swelling on the electrical properties of copper and several copper alloys.** Edwards, D.J. (Pacific Northwest Lab., Richland, VA (US)); Garner, F.A. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

A comparison of the predicted and measured electrical conductivities of MARZ copper wand two copper alloys irradiated in FFTF shows that the calculated transmutation rates are ~15% higher than those required to produce the observed changes. It also appears that the contribution of transmutants and void swelling to conductivity changes are directly additive. Of the several models available, Euken's model has been found to best describe the contribution of void swelling.

34571 (DOE/ER–0313/13, pp. 265-266) **Status of low cycle fatigue studies on irradiated copper.** Garner, F.A. (Pacific Northwest Lab., Richland, VA (US)); Singh, B.N.; Stubbins, J.F. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

A joint irradiation program is being conducted by the Riso National Laboratory, Pacific Northwest Laboratory and the University of Illinois to study the influence of neutron irradiation on the low cycle fatigue behavior of copper alloys. This program is directed toward both NET and ITER goals. Radiation is proceeding on miniature specimens in the DR-3 reactor in Riso, and identical specimens have been prepared for the COBRA-1A experiment in EBR-II. A size effect study on unirradiated specimens is in progress.

34572 (DOE/ER–0313/13, pp. 269-275) **Development of electrical insulator coatings for liquid-metal blanket applications.** Park, J.H.; Fox, M.R.; Dragel, G. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Based on a preliminary survey of more than 15 oxides and nitrides, four ceramic materials (CaO, MgO, Y^2O^3, and BN) were identified as candidates for insulator coating development. These compounds were fabricated by various techniques and exposed to flowing Li at 400-410° to assess chemical compatibility. Yttrium oxide exhibited excellent corrosion resistance in flowing liquid Li at 400°C; its corrosion rate was calculated to be 0.042 μm/hr. Resistivity measurements by a standard four-probe method on Y^2O^3 in air at temperatures between ~450 and 1000°C, before and after exposure to Li for 675 h at 410°C, indicated no deterioration in resistivity. The resistivity of in-situ-formed $(V,Ti)^xN$ reaction-product layers on V-20Ti and TiN on Ti was determined at room temperature and 80°C by a two-probe method. The resistivity of the film on the V-20Ti alloy was low (~20 Ωm) and the film on Ti exhibited metallic conduction. Adhesion bonding between Y^2O^3 and Y, V, Ti, Y, V-20Ti, V-3Ti-1Si, and Types 304 and 316 stainless steel was investigated in reducing and oxidizing gaseous environments at 927°C. Except for the V-20Ti alloy, the V-base alloys, Ti, and Type 304 stainless steel were well bonded to Y^2O^3 in the reducing atmosphere. In the oxidizing atmosphere, bond regions of Types 304 and 316 stainless steel were better than in the reducing atmosphere because of reaction between the oxide scale on the steels (Cr^2O^3) and Y^2O^3 to form $YCrO^3$. Neither V, Ti, nor the V-alloys bonded with Y^2O^3. These results suggest that a low-melting eutectic layer forms between Y^2O^3 and the oxides layers present on V, Ti, and V-alloys.

34573 (DOE/ER–0313/13, pp. 276-284) **Aqueous stress corrosion of candidate austenitic steels for iter structural applications.** French, D.M.; Soppet, W.K.; Kassner, T.F. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Susceptibility of Types 316NG and sensitized 304 stainless steels (SS) to SCC was investigated at temperatures of 60-289°C in slow-strain-rate-tensile (SSRT) tests in oxygenated water that simulates important parameters anticipated in first-wall/blanket systems. Several additional SSRT tests were performed on crevice specimens of Type 316NG SS in oxygenated water containing 100 ppb sulfate at temperatures between 150 and 289°C to establish the effect of temperature on SCC resistance. This steel exhibits good resistance to SCC under crevice and noncrevice conditions at temperatures <150°C in a nominal ITER coolant chemistry. In contrast, sensitized Type 304 SS exhibited intergranular stress corrosion cracking (IGSCC) at <100°C under crevice conditions. SSRT tests have been conducted on weldment specimens of Type 316L SS with matching filler metal under crevice conditions in oxygenated water containing 0.06-6.0 ppm chloride at 150-225°C. Most specimens fractured in the base metal, and several others

fractured in the heat-affected zone (HAZ) of the weld, but none failed in the weld metal.

34574 (DOE/ER–0313/13, pp. 285-289) **Development of in-situ-formed electrical insulator coatings on high-temperature alloys in lithium.** Park, J.H.; Dragel, G. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Various intermetallic films were produced on vanadium, vanadium-base alloys, and Types 304 and 316 stainless steel (SS) by exposing the materials to liquid- and/or vapor-phase lithium containing dissolved elements (3-5 at. %) in sealed capsules at temperatures between 600 and 775°C. After each test, the capsules were opened and the samples were examined by optical and scanning electron microscopy; they were then analyzed by electron-energy-dispersive and X-ray diffraction techniques. The nature of the coatings, i.e., surface coverage, thickness, and composition, varied with exposure time and temperature, solute in lithium, and alloy composition. Solute elements that yielded adherent coatings on various substrates provide a means of developing in-situ electrical insulator coatings by oxidation of the reactive layers with dissolved oxygen and/or nitrogen in liquid lithium.

34575 (DOE/ER–0313/13, pp. 290-294) **Electrical insulator coatings for liquid-metal blanket applications-yttria coating on vanadium.** Fox, M.R.; Park, J.H. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Research has been conducted to develop a diffusion coating of Y^2O^3 on the surface of V, which could help eliminate the MHD effect. The process involves yttriding, in which a diffusion coating of Y is formed on the surface of V by immersing the samples in a molten salt and applying a potential. The yttrium layer can then be oxidized to form the electrical insulator Y^2O^3. An yttrium coating up to 10 μm in thickness with a diffusion zone of ~1 μm has been produced.

34576 (DOE/ER–0313/13, pp. 297-301) **Tritium release from ceramic breeder materials.** Kopasz, J.P.; Seils, C.A.; Johnson, C.E. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Lithium aluminate is an attractive material (in terms of its chemical, mechanical, and irradiation properties) for breeding tritium in fusion reactors; however, its tritium release characteristics are not as good as those of other candidate materials. To investigate whether tritium release from lithium aluminate can be improved, tritium release has been studied from irradiated samples of lithium aluminate, lithium aluminate doped with magnesium, and lithium aluminate with a surface deposit of platinum. The release was studied using the Temperature Programmed Desorption (TPD) method. Both the platinum coating and magnesium doping were found to improve the tritium release characteristics as determined by TPD. Tritium release shifted to lower activation energies for the altered materials. In addition, information gained from the TPD experiments on the pure material were used to improve a tritium release model. The new model containing no adjustable parameters was used to successfully model in-pile tritium release from $LiA1O_2$.

34577 (DOE/ER–0313/13, pp. 302-304) **Tritium modeling/ BEATRIX-II data analysis.** Billone, M.C.; Attaya, H.; Johnson, C.E.; Kopasz, J.P. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Models have been developed to describe the tritium transport in Li_2O. The mechanisms considered are bulk diffusion, surface desorption, surface adsorption, and solubility. These models have been incorporated into the TIARA steady-state inventory code and the DISPL2 steady-state and transient code. Preliminary validation efforts have focused on the inventory and tritium release rate data from in-reactor, purge-flow tests VOM-15H, EXOTIC-2, CRITIC-1, and MOZART. The models and validation effort are reported in detail in ANL/FPP/TM-260. Since the BEATRIX-II data were released officially in November 1991, validation efforts have been concentrated on the tritium release rate data from the "isothermal" thin-ring sample. In this report, results are presented for the comparison of predicted long-time inventory changes (in response to temperature and hydrogen purge pressure changes) to values determined from the tritium release data.

34578 (DOE/ER–0313/13, pp. 305-307) **Desorption characteristics of the Li_2O system.** Fischer, A.K.; Johnson, C.E. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Preparations were completed for temperature programmed desorption (TPD) measurements of the kinetics of desorption from the D_2-H_2-HD-HDO-H_2O-Li_2O system. These preparations consisted of a series of blank and calibrating runs to determine the effects of the empty sample tube on the TPD spectra and to calibrate the mass spectrometer for the gaseous species of interest. Data from the blank tube runs revealed the importance of isotope exchange reactions in interpreting desorption data. A preliminary examination was made of the raw spectra of desorption from Li_2O that had been treated with Ar-D_2 (921 vppm) at temperatures of 374, 673, 873, and 1108 K (200, 400, 600, and 835°C). The TPD spectra appear to contain fewer peaks than were observed earlier for $LiA10_2$.

34579 (DOE/ER–0313/13, pp. 308-311) **Tritium transport in single crystal $LiAlO_2$.** Kopasz, J.P.; Seils, C.A.; Johnson, C.E. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract W-31109-ENG-38. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Tritium transport in $LiA10_2$ has been studied by performing isothermal anneals followed by sectioning of the sample to determine the tritium concentration profiles within the sample. The anneals were performed over the 528 to 783°C temperature range under a He + 0.1%H_2 purge gas flow. The results indicate that: (1) tritium diffusion in $LiA10_2$ is fast, and is not sensitive to impurities, and (2) tritium release for these samples is in the mixed diffusion-desorption regime. For samples with a grain size of 100 μm or less, the tritium release will be desorption controlled.

34580 (DOE/ER–0313/13, pp. 312-317) **Neutron irradiation of beryllium: Recent Russian results.** Gelles, D.S. (Pacific Northwest Lab., Richland, VA (US)). Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Results on postirradiation tensile and compression testing, swelling and bubble growth during annealing for various grades of beryllium are presented. It is shown that swelling at temperatures above 550°C is sensitive to material condition and response is correlated with oxygen content. Swelling on the order of 15% can be expected at 700°C for doses on the order of 10^{22} n/cm^2. Bubble growth response depends on irradiation fluence.

34581 (DOE/ER–0313/13, pp. 321-325) **Measurement of electrical and optical properties of dielectric materials during neutron irradiation.** Farnum, E.H.; Clinard, F.W.; Kennedy, J.C.; Sommer, W.F.; Unruh, W.P. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

An irradiation experiment was carried out during the summer of 1992 at the Los Alamos Spallation Radiation Effects Facility (LASREF). In situ measurements of electrical conductivity in alumina, sapphire and mineral-insulated electrical cables were made at 640°C, 590°C and 400°C. Both DC and AC (100 Hz to 1 MHz) measurements were made to a fluence of approximately 2 x 10^{23} n/m^2. Optical absorption from 200 nm to 800 nm was measured in

pure silica- and OH-doped silica-core optical fibers during the irradiation. A large number of passive samples were included in the irradiation, some at the furnace temperatures and some at ambient temperature. Data is being analyzed during the first quarter of FY93. All samples will be recovered for post-irradiation examination during the second quarter of FY93.

34582 (DOE/ER–0313/13, pp. 326-329) **The effect of vacancies on the thermal conductivity of single crystal alumina (sapphire) at low temperatures.** White, D.P. (Oak Ridge National Lab., TN (US)). Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The effect of radiation on the thermal conductivity of alumina is an important design consideration in the development of microwave windows for ion cyclotron resonance heating (ICRH) systems for the heating of plasmas in fusion reactors. Several recent papers have addressed this question at higher temperatures and the present report extends the calculation of the effect of point defects to low temperatures. This extension of the calculations to low temperatures is of interest because it has been proposed to cool these windows to liquid nitrogen temperatures in order to take advantage of the much higher thermal conductivity of alumina at these temperatures.

34583 (DOE/ER–0313/13, pp. 330-340) **Fatigue crack growth of SiC/SiC at 1100°C.** Jones, R.H. (Pacific Northwest Lab., Richland, WA (US)); Henager, C.H. Oak Ridge National Lab., TN (United States). [1992]. DOE Contract AC06-76RL01830. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

Fatigue crack growth tests have been conducted on a SiC/SiC composite at 1100°C and a stress intensity ratio of 0.1. Tests were conducted in pure Ar and Ar + 2000 ppm O_2 to determine the effects of an oxidizing environment. The crack growth rate-stress intensity relationship exhibits a K independent regime, stage II, which is not exhibited in monolithic ceramics. The crack velocity in this stage II regime ranged from a low of 10^{-8} m/s to a high of 10^{-7} m/s. Cyclic stresses were found to decrease the crack velocity relative to static loads while oxygen increased the crack velocity. Both effects are consistent with a model developed to describe the subcritical crack growth of these materials where the fibers bridging the crack wake produce crack closure forces which reduce the crack tip K value. The decrease in crack velocity with cyclic loading resulted primarily from the longer hold-times at a given K value without any apparent cyclic damage. Based on these tests and other published data, cyclic stresses may not pose a fatigue concern for SiC/SiC if the stresses are below the proportional limit and the stress or stress intensity ratio is >0 and tension-tension. Further tests are in progress to evaluate the effect of hold-time on crack growth rates in SiC/SiC.

34584 (DOE/ER–0313/13, pp. 341-345) **Radiation enhanced conductivity in silicon carbide materials.** Snead, L.L. (Oak Ridge National Lab., TN (US)); Ohland, M.; Vesey R.A. Oak Ridge National Lab., TN (United States). [1992]. (ORNL/M–2722). In *Fusion reactor materials semiannual progress report for period ending September 30, 1992.* 378p. Order Number DE93013462. Source: OSTI; NTIS; INIS.

The radiation enhanced conductivity (REC) in four types of silicon carbide based materials was measured. As expected, the material with the highest initial conductivity showed the lowest conductivity enhancement. Chemically vapor deposited material showed only a few percent change at ionizing fluxes of several Gy/s. Two materials with higher initial resistivities demonstrated significant REC, the highest resistivity of the two changing by more than a factor of thirty for a dose of 4.2 Gy/s.

34585 (DOE/ER–0592) **Review Committee report on the conceptual design of the Tokamak Physics Experiment.** US-DOE Office of Energy Research, Washington, DC (United States). Apr 1993. 198p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93018408. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics on the conceptual design of the Tokamak Physics Experiment: Role and mission of TPX; overview of design; physics design assessment; engineering design assessment; evaluation of cost, schedule, and management plans; and, environment safety and health.

34586 (DOE/ER/54100–1-Vol.1) **Osiris and SOMBRERO inertial confinement fusion power plant designs: Volume 1, Executive summary and overview, Final report.** Meier, W.R.; Bieri, R.L.; Monsler, M.J. Schafer (W.J.) Associates, Inc., Wakefield, MA (United States). Mar 1992. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90ER54100. (WJSA–92-01-Vol.1). Order Number DE93019139. Source: OSTI; NTIS; INIS; GPO Dep.

Conceptual designs and assessments have been completed for two inertial fusion energy (IFE) electric power plants. The detailed designs and results of the assessment studies are presented in this report. Osiris is a heavy-ion-beam (HIB) driven power plant and SOMBRERO is a Krypton-Fluoride (KrF) laser-driven power plant. Both plants are sized for a net electric power of 1000 MWe.

34587 (DOE/ER/54100–1-Vol.2) **Osiris and SOMBRERO inertial confinement fusion power plant designs: Volume 2, Designs, assessments, and comparisons, Final report.** Meier, W.R.; Bieri, R.L.; Monsler, M.J. Schafer (W.J.) Associates, Inc., Wakefield, MA (United States). Mar 1992. 646p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90ER54100. (WJSA–92-01-Vol.2). Order Number DE93019140. Source: OSTI; NTIS; INIS; GPO Dep.

The primary objective of the of the IFE Reactor Design Studies was to provide the Office of Fusion Energy with an evaluation of the potential of inertial fusion for electric power production. The term reactor studies is somewhat of a misnomer since these studies included the conceptual design and analysis of all aspects of the IFE power plants: the chambers, heat transport and power conversion systems, other balance of plant facilities, target systems (including the target production, injection, and tracking systems), and the two drivers. The scope of the IFE Reactor Design Studies was quite ambitious. The majority of our effort was spent on the conceptual design of two IFE electric power plants, one using an induction linac heavy ion beam (HIB) driver and the other using a Krypton Fluoride (KrF) laser driver. After the two point designs were developed, they were assessed in terms of their (1) environmental and safety aspects; (2) reliability, availability, and maintainability; (3) technical issues and technology development requirements; and (4) economics. Finally, we compared the design features and the results of the assessments for the two designs.

34588 (DOE/ER/54101–T1-Vol.1) **Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 1, Final report.** Waganer, L.M.; Driemeyer, D.E.; Lee, V.D. McDonnell Douglas Corp., St. Louis, MO (United States); Canadian Fusion Fuels Technology Project, Mississauga, ON (Canada); KMS Fusion, Inc., Ann Arbor, MI (United States); TRW Space and Electronics Group, Redondo Beach, CA (United States); Ebasco Services, Inc., New York, NY (United States); SPAR Aerospace Ltd., Brampton, ON (Canada); California Univ., Los Angeles, CA (United States). Mar 1992. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90ER54101. (MDC–92E0008). Order Number DE93018648. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains a review of design studies for inertial confinement reactors. The first of three volumes briefly discusses the following: Introduction; Key objectives, requirements, and assumptions; Systems modeling and trade studies; Prometheus-L reactor plant design overview; Prometheus-H reactor plant design overview; Key technical issues and R&D requirements; Comparison of IFE designs; and study conclusions.

34589 (DOE/ER/54101–T1-Vol.2) **Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 2, Final report.** Waganer, L.M.; Driemeyer, D.E.; Lee, V.D. McDonnell Douglas Corp., St. Louis, MO (United States). Aerospace Group; Canadian Fusion Fuels Technology Project, Mississauga, ON (Canada); KMS Fusion, Inc., Ann Arbor, MI (United States); TRW Space and Electronics Group, Redondo Beach, CA (United

States); Ebasco Services, Inc., New York, NY (United States); SPAR Aerospace Ltd., Brampton, ON (Canada); California Univ., Los Angeles, CA (United States). Mar 1992. 477p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90ER54101. (MDC–92E0008). Order Number DE93018647. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains a review of design studies for Inertial Confinement reactor. This second of three volumes discussions is some detail the following: Objectives, requirements, and assumptions; rationale for design option selection; key technical issues and R&D requirements; and conceptual design selection and description.

34590 (DOE/ER/54101–T1-Vol.3) **Inertial Fusion Energy Reactor Design Studies: Prometheus-L, Prometheus-H: Volume 3, Final report.** Waganer, L.M. (McDonnell Douglas Corp., St. Louis, MO (United States). Aerospace Group); Driemeyer, D.E.; Lee, V.D. McDonnell Douglas Corp., St. Louis, MO (United States). Aerospace Group; Canadian Fusion Fuels Technology Project, Mississauga, ON (Canada); KMS Fusion, Inc., Ann Arbor, MI (United States); TRW Space and Electronics Group, Redondo Beach, CA (United States); Ebasco Services, Inc., New York, NY (United States); SPAR Aerospace Ltd., Brampton, ON (Canada); California Univ., Los Angeles, CA (United States). Mar 1992. 550p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90ER54101. (MDC–92E0008). Order Number DE93018675. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains a review of design studies for inertial confinement reactor. This third of three three volumes discusses the following topics: Driver system definition; vacuum system; fuel processing systems (FPS); cavity design and analysis; heat transport and thermal energy conversion; balance of plant systems; remote maintenance systems; safety and environment; economics; and comparison of IFE designs.

34591 (DOE/FTR–93011430) **[Travel to Germany to attend meeting of the Technical Advisory Committee to the International Thermonuclear Experimental Reactor Council]: Foreign trip report, March 13–18, 1993.** Piet, S.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). 2 Apr 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93011430. Source: OSTI; NTIS (US Sales Only); GPO Dep.

I attended the March 15–17 TAC meeting at the Garching ITER Co-Center (Garching, Germany) on behalf of the US, as one of three designated US experts to advise TAC members. Three of my four primary objectives for the meeting were met, namely establish TAC support for safety objectives and goals, discourage TAC from prohibiting or dictating any material choices, and improve communication with both JCT and TAC personnel. The fourth objective, establishing TAC support for more aggressive (but higher potential performance) in-vessel material choices (ferritic steel?, titanium?, lithium, helium coolant) was not met to my satisfaction. There was limited TAC support for looking at such options but the TAC report shows preference for options (austenitic steel, water) that I believe offer lower performance and, indeed, very low chance of meeting ITER technology missions of 3 MW-yr/m^2 fluence, demonstrating technologies for DEMO, and demonstrating fusion safety and environmental potential.

34592 (DOE/FTR–93014001) **Travel to England for discussion on magnet design options for ITER: Foreign trip report, April 28–May 3, 1992.** Minervini, J.; Montgomery, B. Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center. 9 Jul 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54110. Order Number DE93014001. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This meeting was held in response to a personal offer to P.H. Rebut made last December, to assist him in assessing magnet design options for ITER. P. H. Rebut presented the detail of his most recent proposed magnetic concepts for ITER, which differ somewhat from his previous proposals in the area of in-plane and out-of-plane structural support. Titus presented the results of his structural analysis of the Rebut concept previously available. Minervini present the results of TF and PF conductor analysis carried out by Joel Schultz and himself. Thome presented alternate concepts for fabrication. An extended discussion was held on general R&D needs.

34593 (DOE/FTR–93014806) **Meetings in Germany concerning TEXTOR and ITER: Foreign trip report, February 22–March 3, 1993.** McGrath, R.T. Sandia National Labs., Albuquerque, NM (United States). 4 Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93014806. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Tasks to be executed by Sandia National Laboratories and by KFA - TEXTOR personnel, required to COMPlete the design and fabrication of new limiter tiles for ALT-II, were discussed. Work assignments and schedules were agreed upon. The meeting on Experimental Approach to the Physics of the High Recycling Diverter provided communication between the various home teams and the ITER Joint Central Team. Highlights of this meeting are briefly discussed below. The ASDEX/US DOE Workshop on Edge and Divertor Physics was an excellent exchange of information on divertor measurements and modeling. Highlights of this meeting are briefly discussed below.

34594 (DOE/FTR–93015302) **Travel to Germany and Austria regarding heavy ion fusion and radiation transport: Foreign trip report, January 28–February 15, 1992.** Mehlhorn, T.A. Sandia National Labs., Albuquerque, NM (United States). 27 Mar 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015302. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Enclosed is the trip report for Thomas A. Mehlhorn, Supervisor, Division 1272, dated February 24, 1990 - Trip Number 9108364. This trip included visits to the Max Planck Institute for Quantum Optics, Garching, Germany; the conference on Physics of High Energy Density in Matter, Hirschegg, Klein Walsertal, Austria; the Nuclear Research Center, Karlsruhe, Germany; and the Heavy Ion Research Center, Darmstadt, Germany. The trip was from January 28–February 15, 1992. The primary purpose was to present an invited paper at the Hirschegg Conference. The purpose of the other site visits was to obtain information on the generation and focusing of intense ion beams and the interaction of such ion beams with matter. A synopsis of each visit is included in the attached report.

34595 (DOE/FTR–93015952) **Travel to Japan to collaborate with the JT-60U diverter physics group on the tokamak experiment: Foreign trip report, March 17–April 3, 1993.** Watkins, J.G. Sandia National Labs., Albuquerque, NM (United States). 27 May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015952. Source: OSTI; NTIS (US Sales Only); GPO Dep.

J.Watkins, SNL, New Mexico and a member of the DIII-D diverter physics group, was invited to collaborate with the JT-60U divertor physics group and participate in an experiment at the Naka site. During the first day of the two week visit, a new record for the fusion triple product was achieved on JT-60U. The first ten days on site was spent learning and using the Fujitsu data display computer system to examine experimental data from the February 1993 divertor experiments. Measurements from many divertor diagnostics were studied. Experimental planning meetings were held during this period and an experiment to study the ELMing H mode took place on March 26. Preliminary analysis of the new data was performed. Tours of Naka site facilities were useful for evaluating technical capabilities of the tokamak, diagnostic, and neutral beam development programs. A short visit to NIFS allowed for orientation and evaluation of activities related to divertor physics and the Large Helical Device.

34596 (DOE/FTR–93016797) **Travel to Japan for Material Chemistry 1992 symposium and to collaborate on fusion reactor materials research: Foreign trip report, March 9–17, 1992.** Bastasz, R. Sandia National Labs., Livermore, CA (United States). 6 May 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93016797. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the Material Chemistry '92 Symposium held in Tsukuba, Japan, March 12–13, 1992, and describes some of the current research activities at the Japanese research institutes NRIM, NIRIM, and JAERI (Tokai, and Naka sites).

34597 (DOE/FTR–93017252) **Travel to England for meeting on ITER configuration: Foreign trip report, April 26–May 2, 1992.** Thome, R. Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center. 11 Jun 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54110. Order Number DE93017252. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report briefly discusses the design philosophy for the ITER tokamak.

34598 (DOE/FTR–93017253) **Progress report of collaborative efforts at JET and PBX-M: Foreign trip report, August 30, 1991–February 20, 1992.** Jones, S. Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center. 11 Jun 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54109. Order Number DE93017253. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Since joining MIT as a postdoctoral follow last JUIY, Stephen Jones has participated In research efforts at MIT, JET, and Princeton. The first period, at MIT, lasted five weeks and consisted of helping MIT write the VTF-D proposal, and. helping Jay Kesner initiate LHCD simulations of PBX-M using his now code. The second period, at JET, lasted 6 months and centered on two projects: The first project was to help setup MIT's collaborative efforts with the ECE ballooning mode diagnostic, and the second project was to initiate LHCD simulations by using the Bonoli code on JET's well-diagnosed plasma. The third, and current period of two weeks, has focused on helping the POX-M team with the now hard X-ray imaging diagnostic. This effort, and others, will continue at Princeton for the next 18 months. This report will further detail results of work done at JET, and intended work at Princeton.

34599 (DOE/FTR–93019138) **Travel to Germany as a safety representative of the Joint Central Team (JCT) of the International Thermonuclear Experimental Reactor (ITER): Foreign trip report, July 10–17, 1993.** Piet, S.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). 4 Aug 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93019138. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report covers travel to Garching, Germany as a safety representative of the Joint Central Team (JCT) of the International Thermonuclear Experimental Reactor (ITER). W. Gulden, acting for the European Community (EC) Home Team (HT), arranged an EC meeting on Tuesday, July 13, of those EC countries primarily interested in hosting ITER (France, Sweden, Germany) to discuss the safety level and licensing implications of the current ITER design movement toward using liquid metals. The EC HT Leader, R. Toschi, asked for a representative of the ITER JCT to explain the ITER safety approach and provide safety information.

34600 (EGG-FSP–9971) **HYLIFE-II tritium management system.** Longhurst, G.R.; Dolan, T.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1993. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93019025. Source: OSTI; NTIS; INIS; GPO Dep.

The tritium management system performs seven functions: (1) tritium gas removal from the blast chamber, (2) tritium removal from the Flibe, (3) tritium removal from helium sweep gas, (4) tritium removal from room air, (5) hydrogen isotope separation, (6) release of non-hazardous gases through the stack, (7) fixation and disposal of hazardous effluents. About 2 TBq/s (5 MCi/day) of tritium is bred in the Flibe (Li_2BeF_4) molten salt coolant by neutron absorption. Tritium removal is accomplished by a two-stage vacuum disengager in each of three steam generator loops. Each stage consists of a spray of 0.4 mm diameter, hot Flibe droplets into a vacuum chamber 4 m in diameter and 7 m tall. As droplets fall downward into the vacuum, most of the tritium diffuses out and is pumped away. A fraction $\Phi \approx 10^{-5}$ of the tritium remains in the Flibe as it leaves the second stage of the vacuum disengager, and about 24% of the remaining tritium penetrates through the steam generator tubes, per pass, so the net leakage into the steam system is about 4.7 MBq/s (11 Ci/day). The required Flibe pumping power for the vacuum disengager system is 6.6 MW. With Flibe primary coolant and a vacuum disengager, an intermediate coolant loop is not needed to prevent tritium from leaking into the steam system. An experiment is needed to demonstrate vacuum disengager operation with Flibe. A secondary containment shell with helium sweep gas captures the tritium permeating out of the Flibe ducts, limiting leaks there to about 1 Ci/day. The tritium inventory in the reactor is about 190 g, residing mostly in the large Flibe recirculation duct walls. The total cost of the tritium management system is 92 M$, of which the vacuum disengagers cost = 56%, the blast chamber vacuum system = 15%, the cryogenic plant = 9%, the emergency air cleanup and waste treatment systems each = 6%, the protium removal system = 3%, and the fuel storage system and inert gas system each = 2%.

34601 (ENEA-RT-INN–92-16) **Chemical study of Li_2O Al_2O_3 phases: Preparation, acid dissolution and characterization by infrared analysis.** Zucchi, B. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Zappa, G. Mar 1993. 22p. (RT/INN–92-16). Order Number DE93522934. Source: OSTI; NTIS (US Sales Only).

This paper reports on a preliminary study oriented to develop appropriate methodologies for the chemical characterization of gamma-$LiAlO_2$, a candidate for solid tritium breeders. Several phases of the Li_2O. Al_2O_3 system were synthesized for analytical purposes. Here the preparation methods are briefly described. Tests were conducted on: acid dissolution of Li-2O, Li-3AlO_3, alpha/beta-Li_5AlO_4, alpha/beta/gamma-$LiAlO_2$, ordered-$LiAl_5O_8$ and alpha/gamma-Al_2O_3, with HCl, H_3PO_4 and H_3PO_4-H_2SO_4, applying both open vessel digestion and microwave oven heating. All the Li-Al-O compounds examined were found to be soluble in H_3PO_4: H_2SO_4 (1:1) in the microwave oven. The different methodologies employed to dissolve the species are compared and the IR patterns of pure Li-Al-O compounds are also reported.

34602 (ENEA-RTI-NUCL-FUS–92-01) **ITER Driver Blanket, EC design.** Simbolotti, G. (ENEA, Frascati (Italy). Area Nucleare); Fabrizi, F.; Ferrari, M. 1992. 393p. Contract 88-184. Order Number DE93523003. Source: OSTI; NTIS (US Sales Only).

The International Thermonuclear Experimental Reactor (ITER) is a next generation tokamak the design of which is in progress under the auspices of the IAEA (International Atomic Energy Agency), with the participation of European Community, Japan, Soviet Union and United States of America. The ITER objective is the demonstration of the scientific and technological feasibility of a nuclear fusion via a Deuterium-Tritium (D-T) reaction. Within the framework of the ITER Conceptual Design Activities (CDA, 1988-1990), a conceptual design of the ITER Driver Blanket was carried out by the ENEA (Italian Agency for Energy, New Technologies and the Environment) Fusion Dept., in collaboration with ANSALDO SpA and SRS srl. A non nuclear experimental program is presently in progress aiming at testing the thermal-hydraulics and thermomechanics behaviour of a medium-scale representative blanket mock-up. The EC design was developed on the basis of 'given' design specifications defined by the ITER Team at the beginning of the CDA. Some of these specifications are presently being revised on the basis of results and critical issues found out during the CDA. Accordingly, the EC design will probably be modified and improved during the EDA. The status of the design at the end of CDA is reported in this paper.

34603 (ENEA-RT-NUCL–92-24) **High-speed repetitive pellet injector prototype for magnetic confinement fusion devices.** Frattolillo, A. (Associazione EURATOM-ENEA sulla fusione, Frascati (Italy)); Gasparotto, M.; Scaramuzzi, F. 1992. 6p. Order Number DE93522980. Source: OSTI; NTIS (US Sales Only).

The fuelling requirements of future magnetic confinement devices for controlled thermonuclear research (e. g., ITER) indicate a need to upgrade the performance (speed, mass, number of pellets, etc.) of present-day pellet injectors. An experiment in collaboration between ENEA (Italian Agency for Energy, New Technologies and the Environment) Frascati and ORNL has been started, with the objective of demonstrating a repeating pellet injector capable of delivering D_2 ice pellets at rates around 1 Hz and with speeds in the range 1 -: - 3 km/s, using an existing ORNL extruder and a Frascati two-stage gun. This activity will be carried out in the framework of a collaborative agreement between U.S. D.O.E. and EURATOM-ENEA Association. The result of numerical simulations and preliminary tests of the two devices, which will be matched together in Oak Ridge, are described. The results of a study in

course at CNPM-CNR (under ENEA contract) about the possibility of minimizing piston wear, are also reported.

34604 (ETDE-IT–93-207) **Density limit and confinement in FTU Ohmic plasma.** Alladio, F. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Apicella, M.L.; Apruzzese, G. 1992. 17p. (CONF-920913–33: 14. international conference on plasma physics and controlled nuclear fusion research, Wurzburg (Germany), 30 Sep - 7 oct 1992). Order Number DE93522959. Source: OSTI; NTIS (US Sales Only).

This paper describes the study of ohmic plasma in the high field tokamak FTU (Frascati Tokamak Upgrade). The role of light and metallic impurities is discussed and their influence on the density limit of the device is documented. Results on plasma fuelling are reported, including the first experiments with pellet injection. The measured radial flow velocity of the plasma is found to be in good agreement with the prediction of extended neoclassical theory. The ohmic confinement is documented for normal and detached discharges.

34605 (ETDE-IT–93-212) **ABAQUS application for a thermonuclear plasma facing component.** Pizzuto, A. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Riccardi, B. 1993. 12p. Order Number DE93522977. Source: OSTI; NTIS (US Sales Only).

The Frascati Tokamak Upgrade (FTU), now operating in the ohmic phase with a localized plasma facing component (poloidal limiter), will be supplied with a continuous one (toroidal limiter) to withstand the large heat flux expected during the 8 MW, 8 GHz LH radio frequency heating experimental phase. The FTU toroidal limiter must be installed in the existing vacuum chamber and the solution studied consists of 12 sectors, each 380 x 330 mm. To minimize eddy current effects and to limit thermal mismatches in each sector, twelve Inconel tiles are fixed on a stainless steel tree supporting structure. Since the mechanical behaviour of the limiter is crucial in assessing its reliability, an extensive three dimensional finite elements analysis was performed modelling a quarter of a sector using 20 node brick elements. In particular, a non-linear transient thermal analysis was made under a square wave shaped heat flux history. Then, a fully non-linear (both geometric and material) mechanical analysis was performed to investigate the deformed configuration of the tile + support component and the stress level in the tiles. After that, a ratcheting analysis, based on a simplified model, was made to understand the selected material mechanical behaviour under a sufficient number of cycles. The main results obtained with the analysis are illustrated in the paper.

34606 (ETDE-IT–93-213) **Injection of solid deuterium pellets into Frascati Tokamak Upgrade (FTU).** Alladio, F. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Buratti, P.; Frattolillo, A.; Grolli, M.; Micozzi, P.; Migliori, S.; Tononi, G.; Zerbini, M.; Scaramuzzi, F.; Snipes, J.A. 1989. 5p. Order Number DE93522981. Source: OSTI; NTIS (US Sales Only).

A high-speed D_2 single-pellet injector (SPIN) has been in operation on the Frascati Tokamak Upgrade (FTU) machine since 15 July, 1992. This paper compares the injector performance with simulation codes and reports the experimental results of pellet-plasma interactions in ohmic discharges. The results of cryogenic experiments carried out with the high-speed multi-shot pellet injector for FTU are also presented. In addition, work is being performed on the preliminary development of injectors that meet the requirements of tokamak machines having larger dimensions (or ITER/NET-type devices).

34607 (INIS-RU–353, pp. 40-42) **On the account of mixing effect in numerical simulation of compression of laser shell targets.** Zakharenkov, Yu.A.; Lebo, I.G.; Shpatakovskaya, G.V. AN SSSR, Moscow (Russian Federation). Fizicheskij Inst. 1991. (In Russian). In *Short communications on physics. Experimental and theoretical physics. No. 9.* 48p. Order Number DE94600071. Source: OSTI; NTIS (US Sales Only); INIS.

The effect of mixing during thermonuclear laser target heating and compression was studied. A simple model for the effect accounting in one-dimensional calculation is suggested. The comparison of the calculated results with the data on mass spectrometry of neutral atoms in experiments in the VULKAN facility, was made. The calculation was realized for the target consisting of a glass shell filled with the DT gas at the Nd laser energy of 300J on the second harmonics (0.53 μm) and the Gaussian pulse shape. It is shown that the mixing of the shell material to the DT fuel results not only in the neutron yield decrease and the neutral component spectra change in divergent plasma, but also in change of the target compressed core luminosity.

34608 (LA–12545-MS) **Beryllium processing technology review for applications in plasma-facing components.** Castro, R.G.; Jacobson, L.A.; Stanek, P.W. Los Alamos National Lab., NM (United States). Jul 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93018396. Source: OSTI; NTIS; INIS; GPO Dep.

Materials research and development activities for the International Thermonuclear Experimental Reactor (ITER), i.e., the next generation fusion reactor, are investigating beryllium as the first-wall containment material for the reactor. Important in the selection of beryllium is the ability to process, fabricate and repair beryllium first-wall components using existing technologies. Two issues that will need to be addressed during the engineering design activity will be the bonding of beryllium tiles in high-heat-flux areas of the reactor, and the in situ repair of damaged beryllium tiles. The following review summarizes the current technology associated with welding and joining of beryllium to itself and other materials, and the state-of-the-art in plasma-spray technology as an in situ repair technique for damaged beryllium tiles. In addition, a review of the current status of beryllium technology in the former Soviet Union is also included.

34609 (LA-SUB–93-234) **Computational support and model development for edge-plasma and energy transport simulations: Progress report, 1989.** Prinja, A.K. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Chemical and Nuclear Engineering); Knoll, D. Los Alamos National Lab., NM (United States); New Mexico Univ., Albuquerque, NM (United States). Dept. of Chemical and Nuclear Engineering. [1989]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93018272. Source: OSTI; NTIS; INIS; GPO Dep.

The focus of the work was on two dimensional modelling of scrape-off layer (SOL) and divertor plasmas in the JET tokamak, with the objective of guiding the ITER divertor design, particularly in the area of fundamental edge plasma data. Additionally, a diffusion model for neutral atom transport in edge plasmas was developed and tested.

34610 (LA-UR–93-420) **Development of a non-LTE spectral post-processor for dense plasma simulations with application to spectroscopic diagnostics in spherical implosions at Nova.** Pollak, G.D. (Los Alamos National Lab., NM (United States)); Delamater, N.D.; Nash, J.K.; Hammel, B.A. Los Alamos National Lab., NM (United States). [1993]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-931141–1: Radiative properties of hot dense matter, Santa Barbara, CA (United States), 2-5 Nov 1993). Order Number DE93007327. Source: OSTI; NTIS; GPO Dep.

A new non-LTE spectroscopy post-processing package is described. The package processes dump files from 1 or 2-dimensional radiation-hydrodynamics code simulations. Given the grid motion, temperatures, and ion densities contained in the dump files, as well as data from an arbitrarily detailed atomic model, the post-processor calculates internally consistent detailed frequency dependent opacities and radiation fields. The radiation transport equation is solved in the S_n approximation using lambda iteration. Sub-cycling is used to achieve a more accurate solution to both the kinetics and radiation field calculations. Line broadening is included using Voigt widths based on the atomic rate coefficients, and Stark widths are included for K-shell spectra. The Sobolev escape factor approximation is available as an option. This post-processing package has been used to analyze spectra obtained recently at Nova with Ar doped deuterium filled capsules. The dopant was designed to be primarily a density diagnostic but can also be used for temperature diagnosis as well. We have run this post-processor with a wide array of atomic models for Argon,

ranging from one containing only singly excited levels for the Hydrogenic, He-like, and Li-like sequences, to one containing a large number of doubly- and triply-excited levels in these sequences. We show a strong dependence of the degree of agreement between simulation and experiment on the model complexity with only the most complex model in close agreement.

34611 (LA-UR–93-2700) **Parametric analysis of the ARIES-III D-^{3}He tokamak reactor.** Bathke, C.G. (Los Alamos National Lab., NM (United States)); Werley, K.A.; Miller, R.L.; Krakowski, R.A.; Santarius, J.F. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9307125–1: ^{3}He and fusion power symposium, Madison, WI (United States), 18-22 Jul 1993). Order Number DE93018293. Source: OSTI; NTIS; INIS; GPO Dep.

The multi-institutional ARIES study has completed a series of conceptual designs of tokamak fusion reactors that varies the assumed advances in technology and physics. The ARIES-III design uses a D- ^{3}He fuel cycle and requires significant advances in physics to enhance economic attractiveness. The optimal design was characterized through systems analysis for eventual conceptual engineering design. Results from the systems analysis are summarized, and a comparison with the other ARIES designs is included.

34612 (LBL–33284) **Electrostatic quadrupoles for heavy-ion fusion.** Seidl, P.; Faltens, A. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–569;CONF-930511–340: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018711. Source: OSTI; NTIS; INIS; GPO Dep.

Voltage-holding data for three quadrupole electrode sizes and inter-electrode spacings are reported. The dependence of the breakdown voltage on system size and its influence on the optimum quadrupole size for beam transport in a multiple beam array are discussed.

34613 (LBL–33287) **Induction accelerator development for heavy ion fusion.** Reginato, L.L. Lawrence Berkeley Lab., CA (United States). May 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–572;CONF-930511–341: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018698. Source: OSTI; NTIS; INIS; GPO Dep.

For approximately a decade, the Heavy Ion Fusion Accelerator Research (HIFAR) group at LBL has been exploring the use of induction accelerators with multiple beams as the driver for inertial fusion targets. Scaled experiments have investigated the transport of space charge dominated beams (SBTE), and the current amplification and transverse emittance control in induction linacs (MBE-4) with very encouraging results. In order to study many of the beam manipulations required by a driver and to further develop economically competitive technology, a proposal has been made in partnership with LLNL to build a 10 MeV accelerator and to conduct a series of experiments collectively called the Induction Linac System Experiments (ILSE). The major components critical to the ILSE accelerator are currently under development. We have constructed a full scale induction module and we have tested a number of amorphous magnetic materials developed by Allied Signal to establish an overall optimal design. The electric and magnetic quadrupoles critical to the transport and focusing of heavy ion beams are also under development The hardware is intended to be economically competitive for a driver without sacrificing any of the physics or performance requirements. This paper will concentrate on the recent developments and tests of the major components required by the ILSE accelerator.

34614 (LBL–33289) **Heavy Ion Fusion Injector Program.** Yu, S.; Eylon, S.; Chupp, W.W. Lawrence Berkeley Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–574;CONF-930511–335: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018706. Source: OSTI; NTIS; INIS; GPO Dep.

A program is underway to construct a 2 MV, 800 mA, K^+ injector for heavy ion fusion. The Electrostatic Quadrupole (ESQ) injector configuration consists of a zeolite source, a diode of up to 1 MV, together with several electrostatic quadrupole units to simultaneously focus and accelerate the beam to 2 MV. The key issues of source technology, high voltage breakdown, beam aberrations, and transient effects will be discussed. Results from ongoing experiments and simulations will be presented.

34615 (LBL–33804) **Longitudinal instability in heavy-ion-fusion induction linacs.** Lee, E.P. Lawrence Berkeley Lab., CA (United States). May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–583;CONF-9305136–10: International symposium on heavy ion fusion, Frascati (Italy), 25-28 May 1993). Order Number DE93019242. Source: OSTI; NTIS; INIS; GPO Dep.

A induction linac accelerating a high-current pulse of heavy ions at subrelativistic velocities is predicted to exhibit unstable growth of current fluctuations. An overview is given of the mode character, estimates of growth rates, and their application to an IFE driver. The present and projected effort to understand and ameliorate the instability is described. This includes particle-in-cell simulations, calculation and measurements of impedance, and design of feedback controls.

34616 (ORNL/FTR–4630) **Travel to Italy for conference on Fusion Reactor Materials: Foreign trip report, April 26–May 2, 1993.** Davis, J.W. Oak Ridge National Lab., TN (United States). 27 May 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93015639. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The second meeting of the Organizing Committee covered selection of both oral and poster papers to be presented at the conference as well as reviewing the facility arrangements, program schedule, and publication proceedings. Following the paper review, a tour of the meeting site was made to review hotel accommodations as well as meeting facilities. Participating in this review were roughly 20 scientists representing the European Communities, the Russian Federation, and the United States. There was no Japanese representation.

34617 (PPPL–2912) **Modeling of ultra-high recycling divertors with the PLANET code.** Petravic, M. Princeton Univ., NJ (United States). Plasma Physics Lab. Jul 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE93018389. Source: OSTI; NTIS; INIS; GPO Dep.

The handling of power carried by the charged particles into the scrape-off layer of a tokamak reactor remains a major obstacle for its continuous and reliable operation. Ways of reducing this power through radiation have been studied numerically using fluid models for both the plasma and neutral gas. A new model for the combined plasma and neutral gas 2-D transport capable of simultaneously representing regions of fully-ionized plasma, partially ionized plasma, and pure neutral gas has been assembled and implemented in the PLANET code. Divertor plasma temperatures of just below 1 eV have been achieved in a pure hydrogen plasma, resulting in an ionization-free region together with ionization and recombination fronts detached from the material walls. In this regime energy reaches the walls almost exclusively in the form of radiation which, in principle, solves the divertor heat load problems.

34618 (UCRL-CR–112610) **Pulsed power supply for Nova Upgrade: Final report, August 1, 1991 to March 31, 1992.** Bacon, J.L. (Univ. of Texas, Austin, TX (US). Center for Electromechanics); Kajs, J.P.; Walls, A.; Weldon, W.F.; Zowarka, R.C. Lawrence Livermore National Lab., CA (United States); Texas Univ., Austin, TX (United States). Center for Electromechanics. 1992. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019626. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes work carried out at the Center for Electromechanics at The University of Texas at Austin (CEM-UT). A baseline design of the Nova Upgrade has been completed by Lawrence Livermore National Laboratory. The Nova Upgrade is an 18 beamline Nd: glass laser design utilizing fully relayed 4x4 30

cm aperture segmented optical components. The laser thus consists of 288 independent beamlets nominally producing 1.5 to 2.0 MJ of 0.35 μm light in a 3 to 5 ns pulse. The laser design is extremely flexible and will allow a wide range of pulses to irradiate ICF targets. This facility will demonstrate ignition/gain and the scientific feasibility of ICF for energy and defense applications. The pulsed power requirements for the Nova Upgrade are given. CEM-UT was contracted to study and develop a design for a homopolar generator/inductor (HPG/inductor) opening switch system which would satisfy the pulsed power supply requirements of the Nova Upgrade. The Nd:glass laser amplifiers used in the Nova Upgrade will be powered by light from xenon flashlamps. The pulsed power supply for the Nova Upgrade powers the xenon flashlamps. This design and study was for a power supply to drive flashlamps.

34619 (UCRL-ID–113266) **Improved HYLIFE-II heat transport system and steam power plant: Impact on performance and cost of electricity: Final report for fiscal year 1992.** Hoffman, M.A. (Univ. of California, Davis, CA (US). Dept. of Mechanical, Aeronautical and Materials Engineering); Lee, Ying T. Lawrence Livermore National Lab., CA (United States). Dec 1992. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93017945. Source: OSTI; NTIS; INIS; GPO Dep.

The HYLIFE-II conceptual design has evolved and improved continually over the past four years to its present form. This paper describes the latest FY92 versions, Reference Case H1 (nominally 1 GWe net output) and the Enhanced Case HE (nominally 2 GWe net output), which take advantage of improvements in the tritium management system to eliminate the intermediate loop and the intermediate heat exchangers (IHX's). The improvements in the heat transport system and the steam power plant are described and the resulting cost reductions are evaluated. The new estimated cost of electricity (in 1990 dollars) is 6.6 ¢/kWh for Reference Case H1 and 4.7 ¢/kWh for the Enhanced Case.

34620 (UCRL-JC–112167) **Hydrodynamic instability modeling for ICF.** Haan, S.W. Lawrence Livermore National Lab., CA (United States). 31 Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303126–8: 4. international workshop on the physics of compressible turbulent mixing, Cambridge (United Kingdom), 29 Mar - 1 apr 1993). Order Number DE93018634. Source: OSTI; NTIS; GPO Dep.

The intent of this paper is to review how instability growth is modeled in ICF targets, and to identify the principal issues. Most of the material has been published previously, but is not familiar to a wide audience. Hydrodynamic instabilities are a key issue in ICF. Along with laser-plasma instabilities, they determine the regime in which ignition is possible. At higher laser energies, the same issues determine the achievable gain. Quantitative predictions are therefore of the utmost importance to planning the ICF program, as well as to understanding current Nova results. The key fact that underlies all this work is the stabilization of short wavelengths.

34621 (UCRL-JC–112344) **Simulation of transient effects in the heavy ion fusion injectors.** Chen, Yu-Jiuan; Hewett, D.W. Lawrence Livermore National Lab., CA (United States). 12 May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930511–336: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018658. Source: OSTI; NTIS; GPO Dep.

We have used the 2-D PIC code, GYMNOS, to study the transient behaviors in the Heavy Ion Fusion (HIF) injectors. GYMNOS simulations accurately provide the steady state Child-Langmuir current and the beam transient behavior within a planar diode. The simulations of the LBL HIF ESAC injector experiments agree well with the experimental data and EGUN steady state results. Simulations of the nominal HIF injectors have revealed the need to design the accelerating electrodes carefully to control the ion beam current, particularly the ion loss at the end of the bunch as the extraction voltage is reduced.

34622 (UCRL-JC–112377) **Correction of longitudinal errors in accelerators for heavy-ion fusion.** Sharp, W.M. (Lawrence Livermore National Lab., CA (United States)); Callahan, D.A.; Barnard, J.J.; Langdon, A.B.; Fessenden, T.J. Lawrence Livermore National Lab., CA (United States). 10 Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930511–337: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93018656. Source: OSTI; NTIS; GPO Dep.

Longitudinal space-charge waves develop on heavy-ion inertial-fusion pulse from initial mismatches or from inappropriately timed or shaped accelerating voltages. Without correction, waves moving backward along the beam can grow due to the interaction with their resistively retarded image fields, eventually degrading the longitudinal emittance. A simple correction algorithm is presented here that uses a time-dependent axial electric field to reverse the direction of backward-moving waves. The image fields then damp these forward-moving waves. The method is demonstrated by fluid simulations of an idealized inertial-fusion driver, and practical problems in implementing the algorithm are discussed.

34623 (UCRL-JC–112762) **Thermo-hydraulic analysis of superconducting toroidal-field magnets for the Tokamak Physics Experiment.** Wong, R.L.; Zbasnik, J.P.; Hassenzahl, W.V. Lawrence Livermore National Lab., CA (United States). 9 Jul 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930703–12: International cryogenic engineering conference and international cryogenic materials conference, Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE93018096. Source: OSTI; NTIS; INIS; GPO Dep.

The superconducting magnets in Fusion Reactors are subjected to pulsed, nuclear, and resistive heating. The thermo-hydraulic response of the helium forced-flow cooled conductors to the various heat sources is critical to magnet design and performance. Recently developed computer codes allow accurate modeling of conductor response and have been used as an aid to design of the toroidal field (TF) magnets for the Tokamak Physics experiment (TPX). We present results of design studies that determine the trade-off between double- and single-pancake helium flow configurations, the minimum-temperature margin, and the stability against rapid heat input. The results guide the choice and design of the liquid helium refrigerator.

34624 (UCRL-JC–113033) **Radiative divertor modeling studies.** Rensink, M.E.; Allen, S.L.; Hill, D.N.; Kaiser, T.B.; Rognlien, T.D. Lawrence Livermore National Lab., CA (United States). 5 May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930720–18: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93018092. Source: OSTI; NTIS; INIS; GPO Dep.

A two-dimensional fluid code called UEDGE is used to simulate the edge plasma in tokamak divertors and to evaluate methods for reducing the heat load on divertor plates by radiating some of the power before it reaches the plates. UEDGE is a fully-implicit code being developed jointly by us, D. A. Knoll and R. B. Campbell. For these studies, UEDGE uses a banded matrix solver and a fixed-fraction impurity model. Work is presently underway with Knoll and Campbell to include a memory-efficient iterative solver and a model of impurity transport. Simulations of the proposed TPX device show that a few percent nitrogen concentration in the scrape-off layer can radiate up to 80% of the divertor power, thus reducing the peak heat flux and electron temperature at the divertor plate to acceptable values. A comparison of the neutral gas distribution from UEDGE with results from the DEGAS Monte Carlo neutrals code confirms the validity of our fluid neutrals model.

34625 (UCRL-JC–114531) **Design of a tunable 4-MW Free Electron Maser for heating fusion plasmas.** Caplan, M.; Kamin, G.; Shang, C.C.; Lindquist, W. Lawrence Livermore National Lab., CA (United States). Sep 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9309124–1: 18. annual international conference on infrared and millimeter waves, Colchester (United Kingdom), 6-10 Sep 1993). Order Number DE93017172. Source: OSTI; NTIS; INIS; GPO Dep.

There is an ongoing program at the FOM institute, The Netherlands, to develop a 1-MW, long-pulse, 200-Ghz Free Electron Maser (FEM) using a DC accelerator system with depressed collector. We present an extrapolation of this design to more than 4MW of output microwave power in order to reduce the cost per kW and increase the power per module in a plasma heating system.

34626 (WSRC-MS–93-091) **Overlay welding irradiated stainless steel.** Kanne, W.R.; Chandler, G.T.; Nelson, D.Z.; Franco-Ferreira, E.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930928–1: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993). Order Number DE93018767. Source: OSTI; NTIS; INIS; GPO Dep.

An overlay technique developed for welding irradiated stainless steel may be important for repair or modification of fusion reactor materials. Helium, present due to n,α reactions, is known to cause cracking using conventional welding methods. Stainless steel impregnated with 3 to 220 appm helium by decay of tritium was used to develop a welding process that could be used for repair. The result was a gas metal arc weld overlay technique with low-heat input and low-penetration into the helium-containing material. Extensive metallurgical and mechanical testing of this technique demonstrated substantial reduction of helium embrittlement damage. The overlay technique was applied to irradiated 304 stainless steel containing 10 appm helium. Surface cracking, present in conventional welds made on the same steel at lower helium concentrations, was eliminated. Underbead cracking, although greater than for tritium charged and aged material, was minimal compared to conventional welding methods.

99 GENERAL AND MISCELLANEOUS

34627 (BNL–52300-Rev.10/92) **The future is yours–Get ready! Career options in scientific and technical fields: Revision.** Brookhaven National Lab., Upton, NY (United States). Oct 1992. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93017985. Source: OSTI; NTIS; GPO Dep.

This 50 page brochure was developed by Brookhaven National Laboratory to encourage high school students to begin considering careers in the scientific and technical fields. The topics of the brochure include career selection, career options, a review of training required for each occupation, a collection of profiles of BNL employees describing how they chose and prepared for their careers, a description of BNL educational programs for high school students, and profiles of some of the students participating in these programs.

34628 (LA-SUB–93-249) **Science and Technology Alliance work schedule FY 1992: Annual report.** Los Alamos National Lab., NM (United States); New Mexico Highlands Univ., Las Vegas, NM (United States). [1992]. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93019294. Source: OSTI; NTIS; GPO Dep.

This report includes operational and financial planning information for fiscal year 1992 for New Mexico Highlands University.

34629 (LBL-PUB–725) **LBL/JSU/AGMUS science consortium annual report, FY 1991–1992.** Lawrence Berkeley Lab., CA (United States). 1992. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93019265. Source: OSTI; NTIS; GPO Dep.

In 1983, a formal Memorandum of Understanding joined the Ana G. Mendez University System (AGMUS), Jackson State University (JSU), and the Lawrence Berkeley Laboratory (LBL) in a consortium designed to advance the science and technology programs of JSU and AGMUS. This is the first such collaboration between a Hispanic university system, a historically Black university, and a national laboratory. The goals of this alliance are basic and direct: to develop and effect a long-term, comprehensive program that will enable the campuses of AGMUS and JSU to provide a broad, high-quality offering in the natural and computer sciences, to increase the number of minority students entering these fields, and to contribute to scientific knowledge and the federal government's science mission through research. This report documents the progress toward these goals and includes individual success stories. The LBL/JSU/AGMUS Science Consortium has developed plans for utilizing its program successes to help other institutions to adopt or adapt those elements of the model that have produced the greatest results. Within the five-year plan formulated in 1990 are eight major components, each with defining elements and goals. These elements have become the components of the Science Consortium's current plan for expansion and propagation.

34630 (UCRL-ID–114953) **INSENS classification algorithm report.** Hernandez, J.E.; Frerking, C.J.; Myers, D.W. Lawrence Livermore National Lab., CA (United States). 28 Jul 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019619. Source: OSTI; NTIS; GPO Dep.

This report describes a new algorithm developed for the Imigration and Naturalization Service (INS) in support of the INSENS project for classifying vehicles and pedestrians using seismic data. This algorithm is less sensitive to nuisance alarms due to environmental events than the previous algorithm. Furthermore, the algorithm is simple enough that it can be implemented in the 8-bit microprocessor used in the INSENS system.

34631 (DOE/FTR–93015323) **Travel to Italy to plan agenda of International Electrotechnical Commission/Technical Committee 82, Solar Photovoltaic Energy Systems meeting: Foreign trip report, May 2–8, 1993.** Klein, R.J. National Renewable Energy Lab., Golden, CO (United States). 9 Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93015323. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details the support provided to the Secretary and necessary technical support personnel for the United States held Secretariat during the IEC/TC82 meeting and its working groups. Both the Assistant Secretary, Mr. Chalmers, and the author met with with Professor Sekine, Chairman of TC82, to discuss each agenda item and plan for a smooth meeting. Several policy issues were discussed and agreed upon.

34632 (DOE/PE/17060–T1) **Record of principal work activities/deliverables: Final technical report, September 28, 1984–September 27, 1989.** Arinc Research Corp., Annapolis, MD (United States). Sep 1989. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-84PE17060. Order Number DE93018605. Source: OSTI; NTIS; INIS; GPO Dep.

Over the five year period of performance, thirteen task assignments were issued by the DOE to ARINC Research. During the two year base period seven tasks were assigned. Two task assignments were issued for each of the three consecutive one year option periods. Associated with all task assignments were multiple subtasks, some of which required significant effort. These subtasks are appropriately cited in this report under their respective task assignments as principal work activities or deliverables. The technical and management support provided to the DOE under this contract focused on two general areas: (1) appraisal activities and (2) non-appraisal activities. Support to appraisals included planning, document review, developing lines-of-inquiry, interviewing, data collection, report writing, and follow-up. Such work was executed both on-site at the DOE facility under review and off-site. Non-appraisal support was varied and included such areas as document review, data base development, technical assessments. statistical analysis, policy analysis, reliability engineering, and workshop and conference planning and execution.

34633 (EGG-M–93052) **Configuration management of DOE facilities – lessons learned.** Klingler, C.M.; Smith, P.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9308110–1: 17. annual symposium of the

Nuclear Information and Records Management Association, Augusta, GA (United States), 29 Aug - 2 sep 1993). Order Number DE93018998. Source: OSTI; NTIS; GPO Dep.

Configuration management (CM) is an integrated management process to ensure that facilities' physical and functional characteristics are maintained in conformance with the facilities' authorization basis and that modifications, maintenance, and operating processes are consistent with the conditions prescribed by the design basis. The Department of Energy (DOE) completed a feasibility study of DOE Nuclear facilities in the area of Configuration Management. The CM review was associated with their effort to review and improve all aspects of DOE Facility and operations safety. Based upon these reviews and discussions with selected utilities and DOE Site Contractors, a recommendation to issue a DOE Order was given resulting in DOE 5480.CM, "Operational Configuration Management." DOE prepared a draft order and issued it for comment to the other DOE Field Offices, and some selected Maintenance and Operations (M&O) Contractors. Another DOE Headquarters group is preparing a CM Order DOE 663, Configuration Management for Non-Nuclear Facilities. EG&G Idaho used the DOE Orders on several nuclear facilities and has some lessons learned they desire to share with the DOE nuclear and non-nuclear industry. This session will discuss an overall CM Program and give lessons learned when available.

34634 (INIS-mf–13690) **Statens Straalevern.** Statens Straalevern, Oesteraas (Norway). Jun 1993. 12p. (In Norwegian). Order Number DE94600345. Source: OSTI; NTIS; INIS.

This booklet describes the functions and responsibilities of the Norwegian Radiation Protection Authority which was established at the commencement of 1993. The former National Institute of Radiation Protection and Nuclear Energy Safety Authority have merged into the new organization which is attached to the Ministry of Health and Social Affairs.

34635 (LA-UR–93-913) **Preparing organizations to qualify/certify training staff members: A case study with implications for continuing professional education.** Jannotta, M.; Houghton, K. Los Alamos National Lab., NM (United States). Nov 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-931066–1: American Association of Adult Continuing Education (AAACE) conference, Dallas, TX (United States), Oct 1993). Order Number DE93010706. Source: OSTI; NTIS; GPO Dep.

In keeping with LANL policy to apply the principles of performance-based training (PBT), the Laboratory Training Office conducted a job/task survey prior to developing the procedure for training staff qualification. Over one hundred Laboratory employees whose roles include training responded. While there is a significant amount of training conducted at the Laboratory, findings indicate a need for (a) increased, specific documentation of training and related activities; (b) greater understanding and application of PBT by laboratory training staff; (c) isolating and responding to the reasons training staff are reluctant to attend Laboratory-sponsored PBT and OJT training, even when the need for such training was recognized by respondents. Most training staff members have roles other than the training role. Nonetheless they perform several training functions. About half the training staff do not provide training which addresses PBT standards, especially in the areas of analysis (which directly impacts resource requirements), evaluation (which directly impacts quality), and documentation (which directly affects liability).

34636 (PNL-MA–599-Vol.1) **Analytical Chemistry Laboratory (ACL) procedure compendium: Volume 1, Administrative.** Pacific Northwest Lab., Richland, WA (United States). Jun 1992. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93019189. Source: OSTI; NTIS; INIS; GPO Dep.

Covered are: analytical laboratory operations (ALO) sample receipt and control, ALO data report/package preparation review and control, single shell tank (PST) project sample tracking system, sample receiving, analytical balances, duties and responsibilities of sample custodian, sample refrigerator temperature monitoring, security, assignment of staff responsibilities, sample storage, data reporting, and general requirements for glassware.

34637 (PNL-SA–22371) **Quality, management, and the interplay of self-assessment, process assessments, and performance-based observations.** Willett, D.J. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930538–4: 4. conduct of operations workshop: the key to continued success, Tampa, FL (United States), 4-6 May 1993). Order Number DE93018787. Source: OSTI; NTIS; GPO Dep.

In this document, the author presents his observations on the topic of quality assurance (QA). Traditionally the focus of quality management has been on QA organizations, manuals, procedures, audits, and assessments; quality was measured by the degree of conformance to specifications or standards. Today quality is defined as satisfying user needs and is measured by user satisfaction. The author proposes that quality is the responsibility of line organizations and staff and not the responsibility of the QA group. This work outlines an effective Conduct of Operations program. The author concludes his observations with a discussion of how quality is analogous to leadership.

34638 (RISO-R–682(EN)) **Materials Department annual report for 1992.** Horsewell, A.; Hansen, N. (eds.). Risoe National Lab., Roskilde (Denmark). Materials Dept. Jun 1993. 62p. Order Number DE94600346. Source: OSTI; NTIS; INIS.

Selected activities of the Materials Department at Risoe National Laboratory during 1992 are described. The work is presented in three chapters: Materials Science, Materials Engineering and Materials Technology. A surveys is given of the Department's participation in international collaboration and of its activities within education and training. Furthermore, the main figures outlining the funding and expenditure of the Department are given. Lists of staff members, visiting scientists, publications, lectures and poster presentations are included. (au) (176 refs.).

34639 (SAND–93-1444C) **Improving quality in a matrix management environment by documenting key processes using project management tools.** Furaus, J.P.; Williams, J.L.; McKeever, P.S.; Figueroa-McInteer, C.; Glidewell, D.D. Sandia National Labs., Albuquerque, NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9310104–1: 24. Project Management Institute annual seminar, San Diego, CA (United States), 1-7 Oct 1993). Order Number DE93016497. Source: OSTI; NTIS; GPO Dep.

The Facilities Organization at Sandia has undergone many changes in the past five years. Management has made a commitment to improve the matrix management system and apply quality principles to the organization. This management commitment enabled Facilities to use project management tools for defining and documenting Facilities key processes. The resulting documentation included implementation plans for defining participant roles and responsibilities, identifying critical success factors, measuring performance, and ensuring continuous improvement. All of this resulted in benefits that demonstrate the value of project management and show how project management and quality are intertwined.

34640 (SSI–93-08) **Project Radiation Protection - East: Status report.** Bennerstedt, T. (Tekno Telje (Sweden)); Snihs, J.O.; Sundewall, H. Swedish Radiation Protection Inst., Stockholm (Sweden). Mar 1993. 32p. (In Swedish). Order Number DE94600347. Source: OSTI; NTIS; INIS.

The Swedish Government has allocated SEK 11 million for support in radiation protection to Central and Eastern Europe, particularly the Baltic states and Russia. The Swedish Radiation Protection Institute is in charge of this program, commonly referred to as Radiation Protection - East. The support will be given in the form of consultancy services, measurement equipment, computer hardware and software, etc. Some 40 projects have been initiated and prioritized in discussions with relevant parties in the East, and bilateral protocols on cooperation have been signed. Most of the projects are in progress and some have already been finalized. An introduction to the aims, organization and practical experience of the work is given in this report, together with a presentation of all

ongoing and planned projects. A financial statement and a quick glance at suggested future projects conclude the report.

34641 (ANL/MCS/CP–80151) **Using semantic information for processing negation and disjunction in logic programs.** Gaasterland, T. (Argonne National Lab., IL (US)); Lobo, J. Argonne National Lab., IL (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9306151–1: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). Order Number DE93017412. Source: OSTI; NTIS; GPO Dep.

There are many applications in which integrity constraints can play an important role. An example is the semantic query optimization method developed by Chakravarthy, Grant, and Minker for definite deductive databases. They use integrity constraints during query processing to prevent the exploration of search space that is bound to fail. In this paper, the authors generalize the semantic query optimization method to apply to negated atoms. The generalized method is referred to as semantic compilation. They show that semantic compilation provides an alternative search space for negative query literals. They also show how semantic compilation can be used to transform a disjunctive database with or without functions and denial constraints without negation into a new disjunctive database that complies with the integrity constraints.

34642 (ANL/MCS/CP–80307) **p4-Linda: A portable implementation of Linda.** Butler, R.M. (University of North Florida, Jacksonville, FL (United States). Div. of Computer and Information Science); Leveton, A.L.; Lusk, E.L. Argonne National Lab., IL (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Grant CCR-9121875. (CONF-9307111–: 2. international symposium on high-performance distributed computing, Spokane, WA (United States), 20-23 Jul 1993). Order Number DE93017752. Source: OSTI; NTIS; GPO Dep.

Facilities such as interprocess communication and protection of shared resources have been added to operating systems to support multiprogramming and have since been adapted to exploit explicit multiprocessing within the scope of two models: the shared-memory model and the distributed (message-passing) model. When multiprocessors (or networks of heterogeneous processors) are used for explicit parallelism, the difference between these models is exposed to the programmer. The p4 tool set was originally developed to buffer the programmer from synchronization issues while offering an added advantage in portability, however two models are often still needed to develop parallel algorithms. We provide two implementations of Linda in an attempt to support a single high-level programming model on top of the existing paradigms in order to provide a consistent semantics regardless of the underlying model. Linda's fundamental properties associated with generative communication eliminate the distinction between shared and distributed memory.

34643 (ANL/MCS-TM–177) **Early experiences with the IBM SP-1.** Gropp, W. (ed.). Argonne National Lab., IL (United States). Jun 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93018398. Source: OSTI; NTIS; GPO Dep.

The IBM SP-1 is IBM's newest parallel distributed-memory computer. As part of a joint project with IBM, Argonne took delivery of an early system in order to evaluate the software environment and to begin porting programming packages and applications to this machine. This report discusses the results of those early efforts. Despite the newness of the machine and the lack of a fast interprocessor switch (part of the SP-1 but not yet available for the machine), every code that they attempted to port ran on the SP-1 with little or no modification. The report concludes with a discussion of expectations for the fast interconnect.

34644 (ANL/NDM–128) **A least-squares computational "tool kit": Nuclear data and measurements series.** Smith, D.L. Argonne National Lab., IL (United States). Apr 1993. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93018400. Source: OSTI; NTIS; INIS; GPO Dep.

The information assembled in this report is intended to offer a useful computational "tool kit" to individuals who are interested in a variety of practical applications for the least-squares method of parameter estimation. The fundamental principles of Bayesian analysis are outlined first and these are applied to development of both the simple and the generalized least-squares conditions. Formal solutions that satisfy these conditions are given subsequently. Their application to both linear and non-linear problems is described in detail. Numerical procedures required to implement these formal solutions are discussed and two utility computer algorithms are offered for this purpose (codes LSIOD and GLSIOD written in FORTRAN). Some simple, easily understood examples are included to illustrate the use of these algorithms. Several related topics are then addressed, including the generation of covariance matrices, the role of iteration in applications of least-squares procedures, the effects of numerical precision and an approach that can be pursued in developing data analysis packages that are directed toward special applications.

34645 (CONF-9302135–2) **The evolution of the PVM concurrent computing system.** Giest, G.A. (Oak Ridge National Lab., TN (United States)); Sunderam, V.S. Oak Ridge National Lab., TN (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Institute for Electronic and Electrical Engineers (IEEE) COMPON spring meeting; San Francisco, CA (United States); 22-26 Feb 1993. Order Number DE93017764. Source: OSTI; NTIS; GPO Dep.

Concurrent and distributed computing, using portable software systems or environments on general purpose networked computing platforms, has recently gained widespread attention. Many such systems have been developed, and several are in production use. This paper describes the evolution of the PVM system, a software infrastructure for concurrent computing in networked environments. PVM has evolved over the past years; it is currently in use at several hundred institutions worldwide for applications ranging from scientific supercomputing to high performance computations in medicine, discrete mathematics, and databases, and for learning parallel programming. We describe the historical evolution of the PVM system, outline the programming model and supported features, present results gained from its use, list representative applications from a variety of disciplines that PVM has been used for, and comment on future trends and ongoing research projects.

34646 (DOE/ER/13190–8) **Singularities and symmetries of nonlinear ordinary and partial differential equations: Final technical report.** Chu, C.K. Columbia Univ., New York, NY (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13190. Order Number DE93040083. Source: OSTI; NTIS; GPO Dep.

Real singularities govern self-focusing singularities and current sheet formation. Complex singularities govern integrable properties, nonintegrable properties, intermittency, and from propagation. This project has studied singularities as both fundamental mathematical objects and as the determining mechanism of crucial physical processes. During the past year, progress was made on: Painleve property and geometry of solvable groups, singularity clustering and psi-lambda series, and current sheet formation in MHD.

34647 (DOE/ER/25122–4) **Optimal eigenvalue computation on distributed-memory MIMD multiprocessors.** Crivelli, S.; Jessup, E.R. Colorado Univ., Boulder, CO (United States). Dept. of

Computer Science. Oct 1992. 20p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG02-92ER25122 ;AC05-84OR21400. Grant CCR-9109785. (CU-CS–617-92;CONF-930331–14: 6. Society for Industrial and Applied Mathematics (SIAM) conference on parallel processing for scientific computing, Norfolk, VA (United States), 21-24 Mar 1993). Order Number DE93018337. Source: OSTI; NTIS; GPO Dep.

Simon proves that bisection is not the optimal method for computing an eigenvalue on a single vector processor. In this paper, we show that his analysis does not extend in a straightforward way to the computation of an eigenvalue on a distributed-memory MIMD multiprocessor. In particular, we show how the optimal number of sections (and processors) to use for multisection depends on variables such as the matrix size and certain parameters inherent to the machine. We also show that parallel multisection outperforms the variant of parallel bisection proposed by Swarztrauber or this problem on a distributed-memory MIMD multiprocessor. We present the results of experiments on the 64-processor Intel iPSC/2 hypercube and the 512-processor Intel Touchstone Delta mesh multiprocessor.

34648 (DOE/ER/25122–5) **A programming paradigm for distributed-memory computers.** Crivelli, S.; Jessup, E.R. Colorado Univ., Boulder, CO (United States). Dept. of Computer Science. 30 Dec 1992. 4p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG02-92ER25122. Grant CCR-9109785. (CONF-930331–13: 6. Society for Industrial and Applied Mathematics (SIAM) conference on parallel processing for scientific computing, Norfolk, VA (United States), 21-24 Mar 1993). Order Number DE93018336. Source: OSTI; NTIS; GPO Dep.

One of the problems that arises in programming a multicomputer is the effective partitioning of the work into tasks and the assigning of those tasks to the processors. We will present a programming paradigm as a method of structuring the algorithms, allowing us to identify and separate programming phases. This paradigm allows us to develop a general software tool for dynamically allocating work to the processors while hiding many details of load balancing. Our paradigm consists of four phases: partitioning the work, mapping the tasks into the processors connected by some virtual topology, running the application program, and embedding the virtual architecture into the actual machine. The paradigm applies to diverse problems and to a variety of multiprocessors without significant reprograming. We will use the multisection method for computing eigenvalues to show how this tool works.

34649 (DOE/FTR–93015530) **Travel to Switzerland to discuss several issues related to computer graphics technology in an effort to understand which direction CERN is moving in this area: Foreign trip report, March 8–16, 1992.** O'Reilly, C. Fermi National Accelerator Lab., Batavia, IL (United States). 20 Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93015530. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to discuss several issues related to computer graphics technology in an effort to understand which direction CERN is moving in this area and how the two laboratories can work synergistically to provide HEP physicists with the best graphics tools. In addition, the traveler shared FNAL's experiences with X terminals with our counterparts at CERN and again build synergies between the two laboratories.

34650 (ENEA-RT-ENERG–91-07) **Constrained functions optimization codes: General applicability.** Lorenzoni, G. (ENEA, Casaccia (Italy). Area Energetica). Feb 1993. 22p. (In Italian). (RT/ENERG–91-07). Order Number DE93522951. Source: OSTI; NTIS (US Sales Only).

Two FORTRAN programs for constrained functions optimization of general applicability are described. The treatment of FORTRAN or table functions is possible. The first program, named REGR, interpolates the studied function, using least squares method. The later program, named LAGR, using Lagrange multipliers method, calculates and orders the possible maximum (or minimum) points of the polynomial produced by REGR.

34651 (ESTSC–000182AL00000) **PDS SHRINK: PDS SHRINK.** Phillion, D. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 15 Dec 1991. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: APPLE MACINTOSH; Machine Dependent; FORTRAN; 3 3.5 Diskettes.

This code enables one to display, take line-outs on, and perform various transformations on an image created by an array of integer*2 data. Uncompressed eight-bit TIFF files created on either the Macintosh or the IBM PC may also be read in and converted to a 16 bit signed integer image. This code is designed to handle all the formats used for PDS (photo-densitometer) files at the Lawrence Livermore National Laboratory. These formats are all explained by the application code. The image may be zoomed infinitely and the gray scale mapping can be easily changed. Line-outs may be horizontal or vertical with arbitrary width, angled with arbitrary end points, or taken along any path. This code is usually used to examine spectrograph data. Spectral lines may be identified and a polynomial fit from position to wavelength may be found. The image array can be remapped so that the pixels all have the same change of lambda width. It is not necessary to do this, however. Lineouts may be printed, saved as Cricket tab-delimited files, or saved as PICT2 files. The plots may be linear, semilog, or logarithmic with nice values and proper scientific notation. Typically, spectral lines are curved.

34652 (ESTSC–000218IBMPC02) **BPM3.0S: Fossil-Fired Boilers.** Kemeny, P. (Burns and Roe Co., Oradell, NJ (United States)); Lagomarsino, J.; Clarke, D.; Kluge, C.R.; Woods, G.; Miller, D.; Landry, A. Burns and Roe Services Corp., Pittsburgh, PA (United States). 1 May 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC88400. Source: ESTSC.

Description: IBM PC; DOS 3.1; Microsoft QuickBASIC; 6 3.5 Diskettes. The SOURCE CODE IS AVAILABLE. The program also checks the required minimum average cold end temperature. If the average cold end temperature is less than the allowable minimum, the air inlet temperature is increased until this requirement is met. The printout will show the total increase in the air inlet temperature over the base temperature of 80 degrees Fahrenheit. The estimated heat input to increase the inlet air temperature to the required temperature is also given to show the required duty of a steam coil air preheater. Directories and paths are hard coded in the source code.

Boiler Performance Model (BPM 3.0S) is a set of computer programs developed to analyze the performance of fossil-fired utility boilers. The programs can model a wide variety of boiler designs, and can model coal, oil, or natural gas firing. The programs are intended for use by engineers performing analyses of alternative fuels, alternative operating modes, or boiler modifications.

34653 (ESTSC–000324IB38600) **EQ3/6 V7.2: Geochemical Modeling Of Aqueous Systems.** Wolery, T.J. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Sep 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC; Lawrence Livermore National Lab.

Description: IBM PC 386; DOS 5.0 or higher with MicroSoftLahey extended Fortran (F77L-EM/32, v. 5.01) with DOS system calls; 4 5.25 Diskettes. EQ3NR input files end in .3i, EQ6 input files end in .6i. This is a recommended convention, and it is required in order to run these codes using the PC interface software. The data file names have the form exemplified by data0.com. Here com is one of the five data file descriptors. This general form is required to run the RUNEQPT script. The main code FORTRAN source files end in .fsc. The PC interface software source codes end in .for. The EPCLIB library supports the PC interface codes. This library is included in the distribution package.

EQ3/6 is a software package for geochemical modeling of aqueous systems. This description pertains to version 7.2. It addresses aqueous speciation, thermodynamic equilibrium, disequilibrium, and chemical kinetics. The major components of the package are EQ3NR, a speciation-solubility code, and EQ6 a reaction path code. EQ3NR is useful for analyzing groundwater chemistry data,

calculating solubility limits, and determining whether certain reactions are in states of equilibrium or disequilibrium. It also initializes EQ6 calculations. EQ6 models the consequences of reacting an aqueous solution with a specified set of reactants (e.g., minerals or waste forms). It can also model fluid mixing and the effects of changes in temperature. Each of five supporting data files contain both standard state and activity coefficient-related data. Three support the use of the Davies or B-dot equations for the activity coefficients; the other two support the use of Pitzer's equations. The temperature range of the thermodynamic data on the data files varies from 25 degrees C only to 0-300 degrees C.

34654 (ESTSC–000324IB48600) **EQ3/6 V7.2: Geochemical Modeling Of Aqueous Systems.** Wolery, T.J. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Sep 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC; Lawrence Livermore National Lab.

The temperature range of the thermodynamic data on the data files varies from 25 degrees C only to 0-300 degrees C.

34655 (ESTSC–000581IBMPC01) **APS1.2: Costs of Building Waste Facilities; Price Per Shipment to Recoup Costs.** Smith, P. (EG and G Idaho, Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). 3 Sep 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: ESTSC.

Description: IBM PC; MS-DOS 5.0, PKZIP 2.046 used to Modula-2; 1 3.5 Diskette. Calls to M2SAGE, a library of reusable Modula-2 code, represent approximately 33 percent of the code. .EXE indicates executable modules, .DFL indicates the data dictionary, .DAT and .IDX indicate the data and index files, .DOC indicates user manual documentation. PKZIP 2.046 used to compress/uncompress files. APS.DOC is the user manual. It was created using Word Perfect 5.1. It is intended for print out to an Hewlett Packard Laser-Jet III or better with fully scalable fonts.

The Automated Pricing Schedule is a computer model for evaluating the economics of developing, operating, and closing a low-level radioactive waste disposal site. It provides pricing for individual shipments based on the characteristics of the shipment, and calculates a disposal fee to be charged for each shipment to recover the costs of the facility. It includes a sensitivity analysis module to evaluate the effect of varying the parameters of the model.

34656 (ESTSC–000593IBMPC00) **GTIPS: Greater Than Class C Tracking, Inventory and Projections System.** Frasure, J. (EG and G Idaho Inc., Idaho Falls, ID (United States)); Stacey, M. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Jan 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: ESTSC.

Description: IBM PC; SCO-Unix; Oracle SQL*Forms 3.0 (95%), C (5%); 1 3.5 Diskette. Reports have the file extension of .TXT, the source for the forms have the extension of .INP, form executables have the file extension .FRM, and the C code has the extension of .PC.

The GTIPS was developed as part of the National Low-Level Waste Management Program's effort to characterize GTCC waste. The primary purpose of this system is to store the Energy Information Administration's (EIA) 1985 survey information (as well as future surveys by the program) in a central location; retrieve data with specific attributes or logical combinations of attributes; generate output in a textual or tabular form to aid in the preparation of reports and other documents required by the user; project a trend of disposal GTCC volumes and activities into the future to aid the user in decision making for the storage and disposal of GTCC waste.

34657 (ESTSC–000601IBMPC00) **IMCS: Item Management Control System.** White, L. (EG and G Idaho Inc., Idaho Falls, ID (United States)); Boyd, K. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Apr 1990. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: IBM PC; DOS 2.11 or greater; Modula; 1 3.5 Diskette. The system was developed using Modula and a database development library called Sage. The software will run on any IBM-PC or similar, using DOS2.11 or greater, and at least 640 k of internal memory. The software supports various types of users, established at the time of software installation; however, because of the DOS environment, it will only support one user at a time.

The Item Management Control System (IMCS) has been developed at Idaho National Engineering Laboratory to assist in organizing collections of documents using an IBM-PC or similar DOS system platform.

34658 (ESTSC–000608IBMPC00) **RSAC-5.1: Radiological Safety Analysis Computer Program.** Wenzel, D.R. (Westinghouse Idaho Nuclear Company, Inc., Idaho Falls, ID (United States)). Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). 1 Oct 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Source: ESTSC.

Description: IBM PC; DOS with a math co-processor; RSAC-5.1 FortranIV, RSAC+ Clarion Professional; 1 3.5 Diskette. While RSAC+ is provided to prepare RSAC-5.1 input files, users can run RSAC-5.1 directly from ASCII files. SOURCE CODE NOT INCLUDED.

RSAC-5.1 calculates the consequences of the release of radionuclides to the atmosphere. Running on a personal computer with a math co-processor, it models the source term from a nuclear event, including generation of fission product inventory from either reactor operating history or criticality events. Users can also input individual nuclides. Source term modelling allows for complete progeny ingrowth and decay during all accident phases. RSAC-5.1 release scenario modelling allows fractionation by chemical group or element and calculates decay and ingrowth during transport through processes, facilities and environment. RSAC-5.1 models the effect of HEPA filters or other clean-up systems. It simulates release through linear or exponential models. RSAC-5.1 meteorological capabilities include Gaussian plume diffusion for Pascal-Gifford, Hilsmeier-Gifford, and Markee models. A unique capability is the ability to model Class F fumigation conditions. Optionally, users supply sigmas or x/Qs to the code as input data. RSAC-5.1 also includes corrections for plume rise and building wake. Calculation of dose can be performed for pathways, including inhalation, ingestion, ground surface, air immersion, water immersion and cloud gamma dose from semi-infinite plume models and finite plume models. A fifty mile population dose, including Regulatory Guide 1.109 modeling, is also available. RSAC-5.1 has been subjected to extensive validation and verification consistent with its historical use for safety related calculations in support of safety analysis reports.

34659 (FNAL/C–93/076) **A multi-thread approach to coalescing small transfers generated by portable tool sets.** Fischler, M.; Uchima, M. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000.

(CONF-931115–1: Supercomputing conference on high performance computing and communications, Portland, OR (United States), 15-19 Nov 1993). Order Number DE93012128. Source: OSTI; NTIS; GPO Dep.

An approach to providing scientific users with the means to code complex algorithms in a natural way is to provide portable tool sets implementing the concepts of each scientific field. These tool sets facilitate implementation on massively parallel systems, but often tend toward large numbers of small inter-CPU data transfers, adversely impacting efficiency. We present techniques for mitigating this effect without affecting the way the user sees the tools. Efficiency improvements obtained by transfer coalescing via "multithreading" are studied in the context of Lattice Gauge Theory computations.

34660 (KEK-PROC–92-16) **Proceedings of the second EGS4 user's meeting in Japan.** Hirayama, Hideo; Namito, Yoshihito; Ban, Syuichi (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1992. 70p. (In Japanese). (CONF-9207216–: 2. EGS4 user's meeting in Japan, Tsukuba (Japan), 20-22 Jul 1992). Order Number DE93520383. Source: OSTI; NTIS; INIS.

This report is the summary of the lectures in second EGS4 study meeting held under the auspices of the Radiation Safety Management Center at National Laboratory for High Energy Physics, from July 20 to 22, 1992. In the study meeting, 79 persons took part, and the new users of EGS4 seem to expand, taking the opportunity of this study meeting. In 13 lectures on the research using EGS4, the stories in wide fields were able to be heard. The interchange of the researches in various fields was able to be carried out through the common means of EGS4, and it was significant. (K.I.).

34661 (LA-SUB–93-214) **Probability computations using the SIGMA-PI method on a personal computer.** Haskin, F.E. (Univ. of New Mexico, Albuquerque, NM (US). Dept. of Chemical and Nuclear Engineering); Lazo, M.S.; Heger, A.S. Los Alamos National Lab., NM (United States); New Mexico Univ., Albuquerque, NM (United States). Dept. of Chemical and Nuclear Engineering. 30 Sep 1990. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93019300. Source: OSTI; NTIS; GPO Dep.

The SIGMA-PI ($\Sigma\Pi$) method as implemented in the SIGPI computer code, is designed to accurately and efficiently evaluate the probability of Boolean expressions in disjunctive normal form given the base event probabilities. The method is not limited to problems in which base event probabilities are small, nor to Boolean expressions that exclude the compliments of base events, nor to problems in which base events are independent. The feasibility of implementing the $\Sigma\Pi$ method on a personal computer has been evaluated, and a version of the SIGPI code capable of quantifying simple Boolean expressions with independent base events on the personal computer has been developed. Tasks required for a fully functional personal computer version of SIGPI have been identified together with enhancements that could be implemented to improve the utility and efficiency of the code.

34662 (LA-UR–93-1244) **A parallel hashed oct-tree N-body algorithm.** Warren, M.S. (Los Alamos National Lab., NM (United States)); Salmon, J.K. Los Alamos National Lab., NM (United States). 29 Mar 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-931115–3: Supercomputing conference on high performance computing and communications, Portland, OR (United States), 15-19 Nov 1993). Order Number DE93012654. Source: OSTI; NTIS; GPO Dep.

We report on an efficient adaptive N-body method which we have recently designed and implemented. The algorithm computers the forces on an arbitrary distribution of bodies in a time which scales as N log N with particle number. The accuracy of the force calculations is analytically bounded, and can be adjusted via a user defined parameter between a few percent relative accuracy, down to machine arithmetic accuracy. Instead of using pointers to indicate the topology of the tree, we identify each possible cell with a key. The mapping of keys into memory locations is achieved via a hash table. This allows us to access data in an efficient manner across multiple processors using a virtual shared memory model. Performance of the parallel program is measured on the 512 processor Intel Touchstone Delta system. We also comment on a number of wide-ranging applications which can benefit from application of this type of algorithm.

34663 (LA-UR–93-2585) **Computer/information security design approaches for Complex 21/Reconfiguration facilities.** Hunteman, W.J. (Los Alamos National Lab., NM (United States)); Zack, N.R.; Jaeger, C.D. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930749–39: 34. annual meeting of the Institute of Nuclear Materials Management, Scottsdale, AZ (United States), 18-21 Jul 1993). Order Number DE93018547. Source: OSTI; NTIS; GPO Dep.

Los Alamos National Laboratory and Sandia National Laboratories have been designated the technical lead laboratories to develop the design of the computer/information security, safeguards, and physical security systems for all of the DOE Complex 21/Reconfiguration facilities. All of the automated information processing systems and networks in these facilities will be required to implement the new DOE orders on computer and information security. The planned approach for a highly integrated information processing capability in each of the facilities will require careful consideration of the requirements in DOE Orders 5639.6 and 1360.2A. The various information protection requirements and user clearances within the facilities will also have a significant effect on the design of the systems and networks. Fulfilling the requirements for proper protection of the information and compliance with DOE orders will be possible because the computer and information security concerns are being incorporated in the early design activities. This paper will discuss the computer and information security addressed in the integrated design effort, uranium/lithium, plutonium, plutonium high explosive/assembly facilities.

34664 (LITH-MAT-R–93-10) **Efficient decomposition and linearization methods for the stochastic transportation problem.** Holmberg, K. Linkoeping Univ. (Sweden). Dept. of Mathematics. [1993]. 28p. Order Number DE94600343. Source: OSTI; NTIS; INIS.

The stochastic transportation problem can be formulated as a convex transportation problem with nonlinear objective function and linear constraints. We compare several different methods based on decomposition techniques and linearization techniques for this problem, trying to find the most efficient method or combination of methods. We discuss and test a separable programming approach, the Frank-Wolfe method with and without modifications, the new technique of mean value cross decomposition and the more well known Lagrangian relaxation with subgradient optimization, as well as combinations of these approaches. Computational tests are presented, indicating that some new combination methods are quite efficient for large scale problems. (authors) (27 refs.).

34665 (NEI-NO–349) **Wave forces on three-dimensional floating bodies with small forward speed.** Nossen, J. Oslo Univ. (Norway). Matematisk Inst. 1989. 46p. Order Number DE93516703. Source: OSTI; NTIS.

A boundary integral method is developed for computing first-order and mean second-order wave forces on floating bodies with small forward speed in three dimensions. The method is based on applying Green's theorem and linearizing the Green function and velocity potential in the forward speed. The velocity potential on the wetted body surface is then given as the solution of two sets of integral equations with unknowns only on the body. The equations contain no waterline integral, and the free surface integral decays rapidly. The Timman-Newman symmetry relations for the added mass and damping are extended to the case when the double-body flow around the body is included in the free surface condition. The linear wave exciting forces are found both by pressure integration and by a generalized far-field form of the Haskind relations. The mean drift force is found by far-field analysis. All the derivations are made for an arbitrary wave heading. A boundary element program utilizing the new method has been developed. Numerical results and convergence tests are presented for several body geometries. It is found that interference phenomena may lead to negative wave drift damping for bodies of complicated shape. 13 refs., 24 figs.

34666 (NEI-NO–357) **Sparse solution of finite element equations.** Damhaug, A.C. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. Sep 1992. 162p. Order Number DE93525289. Source: OSTI; NTIS.

In this work the use of sparse matrix technology in connection with the finite element method has been considered with particular address to large-scale applications. Traditionally the preprocessing phase involved when sparse matrix algorithms are used is expensive compared to envelope methods. A careful study of each necessary step in the preprocessing phase has been made in order to reduce the central processing unit (CPU) time consumption as much as possible. It turned out that there are inherent properties of the finite element method that can be exploited. The result is that the present implementation of the sparse preprocessing phase is comparable to the envelope method both with respect to CPU-time consumption and to storage requirements throughout the phase. This applies to all the test problems used. The current implementation of the preprocessing phase can handle both complete- and partial-factorization. Superelement technique is a well known strategy in computational structural mechanics to solve large problems. The strategy is viewed as a hierarchical method contained in the class of multifront methods, where the superelements are prescribed by the user. The main concern in this study has been to improve the partial factorization step which is needed in the static condensation phase. This is the most demanding step with respect to CPU-time consumption. The present algorithm and its true sparse implementation perform better than both envelope methods and standard sparse methods on the three dimensional shell and solid problems analysed as a part of this study. In addition to the superelement technique the standard multifront technique has also been studied. This technique is ideally suited to the finite element method and its performance on vector supercomputers is good. Out-of-core techniques are logically simple with this method. 87 refs., 48 figs., 12 tabs.

34667 (ORNL/TM–12252) **PUMMA: Parallel Universal Matrix Multiplication Algorithms on distributed memory concurrent computers.** Choi, Jaeyoung (Oak Ridge National Lab., TN (US)); Walker, D.W.; Dongarra, J.J. Oak Ridge National Lab., TN (United States). Aug 1993. 39p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Contract DAAL03-91-C-0047. Order Number DE93019163. Source: OSTI; NTIS; GPO Dep.

This paper describes the Parallel Universal Matrix Multiplication Algorithms (PUMMA) on distributed memory concurrent computers. The PUMMA package includes not only the non-transposed matrix multiplication routine $C = A \cdot B$, but also transposed multiplication routines $C = A^T \cdot B$, $C = A \cdot B^T$, and $C = A^T \cdot B^T$, for a block scattered data distribution. The routines perform efficiently for a wide range of processor configurations and block sizes. The PUMMA together provide the same functionality as the Level 3 BLAS routine xGEMM. Details of the parallel implementation of the routines are given, and results are presented for runs on the Intel Touchstone Delta computer.

34668 (ORNL/TM–12318) **Software distribution using xnetlib.** Dongarra, J.J. (Univ. of Tennessee, Knoxville, TN (US). Dept. of Computer Science); Rowan, T.H.; Wade, R.C. Oak Ridge National Lab., TN (United States). Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93018278. Source: OSTI; NTIS; GPO Dep.

Xnetlib is a new tool for software distribution. Whereas its predecessor netlib uses e-mail as the user interface to its large collection of public-domain mathematical software, xnetlib uses an X Window interface and socket-based communication. Xnetlib makes it easy to search through a large distributed collection of software and to retrieve requested software in seconds.

34669 (ORNL/TM–12347) **The Fourier analysis technique and epsilon-pseudo-eigenvalues.** Donato, J.M. Oak Ridge National Lab., TN (United States). Jul 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93018805. Source: OSTI; NTIS; GPO Dep.

The spectral radii of iteration matrices and the spectra and condition numbers of preconditioned systems are important in forecasting the convergence rates for iterative methods. Unfortunately, the spectra of iteration matrices or preconditioned systems is rarely easily available. The Fourier analysis technique has been shown to be a useful tool in studying the effectiveness of iterative methods by determining approximate expressions for the eigenvalues or condition numbers of matrix systems. For non-symmetric matrices the eigenvalues may be highly sensitive to perturbations. The spectral radii of nonsymmetric iteration matrices may not give a numerically realistic indication of the convergence of the iterative method. Trefethen and others have presented a theory on the use of ϵ-pseudo-eigenvalues in the study of matrix equations. For Toeplitz matrices, we show that the theory of ϵ-pseudo-eigenvalues includes the Fourier analysis technique as a limiting case. For non-Toeplitz matrices, the relationship is not clear. We shall examine this relationship for non-Toeplitz matrices that arise when studying preconditioned systems for methods applied to a two-dimensional discretized elliptic differential equation.

34670 (ORNL/TM–12388) **Are bilinear quadrilaterals better than linear triangles?.** D'Azevedo, E.F. Oak Ridge National Lab., TN (United States). Aug 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93019223. Source: OSTI; NTIS; GPO Dep.

This paper compares the theoretical effectiveness of bilinear approximation over quadrilaterals with linear approximation over triangles. Anisotropic mesh transformation is used to generate asymptotically optimally efficient meshes for piecewise linear interpolation over triangles and bilinear interpolation over quadrilaterals. The theory and numerical results suggest triangles may have a slight advantage over quadrilaterals for interpolating convex data function but bilinear approximation may offer a higher order approximation for saddle-shaped functions on a well-designed mesh. This work is a basic study on optimal meshes with the intention of gaining insight into the more complex meshing problems in finite element analysis.

34671 (ORNL/TM–12408) **Inventory management plan for a research and development local area network.** Strickler, D. (Oak Ridge National Lab., TN (US)); Chester, R.; Ingle, K.; Payne, P.; Rome, J.; Kertis, K. Oak Ridge National Lab., TN (United States). Aug 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93018381. Source: OSTI; NTIS; GPO Dep.

An inventory management plan is presented for the local area network (LAN) for the Security Aspects of Database Management Systems, a Department of Energy (DOE)-sponsored project examining computer and network security in a data management environment. The inventory management plan establishes procedures to ensure that changes in system hardware and software are identified and controlled. Management tools are described, and the roles of the project manager, inventory control manager, and research team members in the implementation of inventory management are defined.

34672 A sequencing and fan-out mechanism for dataflow computing. Grafe, V.G.; Hoch, J.E. To Dept. of Energy. 1991. USA patent application 7-751,002. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93019326. Source: OSTI; NTIS; GPO Dep.

A sequencing and data fanout mechanism is provided for a dataflow processor is activated by an input token which causes a sequence of operations to occur by initiating a first instruction to act on data contained within the token and then executing a sequential thread of instructions identified by either a repeat count and an offset within the token, or by an offset within each preceding instruction.

34673 (SAND–92-2521) **How to apply the IEEE standards to software testing.** Klamerus, J.; Weeks, J. Sandia National Labs., Albuquerque, NM (United States). Jun 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018514. Source: OSTI; NTIS; GPO Dep.

Testing is an important part of the software application development process. To achieve quality software deliverables and to avoid costly redevelopment of program code or repair of bad data, testing must be performed throughout the software development life cycle. This paper discusses a software engineering process to produce a software test plan based upon the "IEEE (Institute of Electrical and Electronics Engineers) Software Engineering Standards Collection" guidelines and corporate guidelines. Demonstrated examples of the software testing process involving interactive graphical user interface software and standard ASCII forms-based text are provided. Sandia National Laboratories has a Software Quality Assurance Department which provides corporate guidelines, in addition to recommending the use of IEEE processes. Both corporate guidelines and a specific subset of the IEEE guidelines were applied to the software development projects discussed herein. The rationale for applying a specific subset of the IEEE guidelines for each of the software development projects will be given. The development of the test procedures in the INGRES/WINDOWS 4GL environment (graphical user interface) as well as in the INGRES/ABF environment (Applications-By-Forms, ASCII Text) are presented and contrasted. The documentation of the testing process and results are explained.

34674 (SAND–93-0587) **Downsizing a database platform for increased performance and decreased costs.** Miller, M.M.; Tolendino, L.F. Sandia National Labs., Albuquerque, NM (United States). Jun 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018687. Source: OSTI; NTIS; GPO Dep.

Technological advances in the world of microcomputers have brought forth affordable systems and powerful software than can compete with the more traditional world of minicomputers. This paper describes an effort at Sandia National Laboratories to decrease operational and maintenance costs and increase performance by moving a database system from a minicomputer to a microcomputer.

34675 (SAND–93-0917C) **A visualization environment for supercomputing-based applications in computational mechanics.** Pavlakos, C.J.; Schoof, L.A.; Mareda, J.F. Sandia National Labs., Albuquerque, NM (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-931115–7: Supercomputing conference on high performance computing and communications, Portland, OR (United States), 15-19 Nov 1993). Order Number DE93015024. Source: OSTI; NTIS; GPO Dep.

In this paper, we characterize a visualization environment that has been designed and prototyped for a large community of scientists and engineers, with an emphasis in superconducting-based computational mechanics. The proposed environment makes use of a visualization server concept to provide effective, interactive visualization to the user's desktop. Benefits of using the visualization server approach are discussed. Some thoughts regarding desirable features for visualization server hardware architectures are also addressed. A brief discussion of the software environment is included. The paper concludes by summarizing certain observations which we have made regarding the implementation of such visualization environments.

34676 (SAND–93-0934C) **Experience in implementing a parallel file system.** Riesen, R. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Computer Science); Maccabe, A.B.; Wheat, S.R. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-931115–4: Supercomputing conference on high performance computing and communications, Portland, OR (United States), 15-19 Nov 1993). Order Number DE93012840. Source: OSTI; NTIS; GPO Dep.

With ever increasing processor and memory speeds, new methods to overcome the "I/O bottleneck" need to be found. This is especially true for massively parallel computers that need to store and retrieve large amounts of data fast and reliably, to fully utilize the available processing power. We have designed and implemented a parallel file system, that distributes the work of transferring data to and from mass storage, across several I/O nodes and communication channels. The prototype parallel file system makes use of the existing single threaded file system of the Sandia/University of New Mexico Operating System (SUNMOS). SUNMOS is a joint project between Sandia National Laboratory and the University of New Mexico to create a small and efficient OS for Massively Parallel (MP) Multiple Instruction, Multiple Data (MIMD) machines. We chose file striping to interleave files across sixteen disks. By using source-routing of messages we were able to increase throughput beyond the maximum single channel bandwidth the default routing algorithm of the nCUBE 2 hypercube allows. We describe our implementation, the results of our experiments, and the influence this work has had on the design of the Performance-oriented, User-managed, Messaging Architecture (PUMA) operating system, the successor to SUNMOS.

34677 (SAND–93-0935C) **Message passing in PUMA.** Maccabe, A.B. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Computer Science); Wheat, S.R. Sandia National Labs., Albuquerque, NM (United States); New Mexico Univ., Albuquerque, NM (United States). Dept. of Computer Science. [1993]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-931115–5: Supercomputing conference on high performance computing and communications, Portland, OR (United States), 15-19 Nov 1993). Order Number DE93012841. Source: OSTI; NTIS; GPO Dep.

This paper provides an overview of the message passing primitives provided by PUMA (Performance-oriented, User-managed Messaging Architecture). Message passing in PUMA is based on the concept of a portal–an opening in the address space of an application process. Once an application process has established a portal, other processes can write values into the memory associated with the portal using a simple send operation. Because messages are written directly into the address space of the receiving process, there is not need to buffer messages in the PUMA kernel. This simplifies the design of the kernel, increasing its reliability and portability. Moreover, because messages are mapped directly into the address space of the application process, the application can manage the messages that it receives without needing direct support from the kernel.

34678 (SAND–93-0936C) **A massively parallel adaptive finite element method with dynamic load balancing.** Devine, K.D. (Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Computer Science); Flaherty, J.E.; Wheat, S.R.; Maccabe, A.B. Sandia National Labs., Albuquerque, NM (United States). [1993]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-931115–2: Supercomputing conference on high performance computing and communications, Portland, OR (United States), 15-19 Nov 1993). Order Number DE93012844. Source: OSTI; NTIS; GPO Dep.

We construct massively parallel, adaptive finite element methods for the solution of hyperbolic conservation laws in one and two dimensions. Spatial discretization is performed by a discontinuous Galerkin finite element method using a basis of piecewise Legendre polynomials. Temporal discretization utilizes a Runge-Kutta method. Dissipative fluxes and projection limiting prevent oscillations near solution discontinuities. The resulting method is of high order and may be parallelized efficiently on MIMD computers. We demonstrate parallel efficiency through computations on a 1024-processor nCUBE/2 hypercube. We also present results using adaptive p-refinement to reduce the computational cost of the method. We describe tiling, a dynamic, element-based data migration system. Tiling dynamically maintains global load balance in the adaptive method by overlapping neighborhoods of processors, where each neighborhood performs local load balancing. We demonstrate the effectiveness of the dynamic load balancing with adaptive p-refinement examples.

34679 (SAND–93-0940) **Object-oriented DFD models to present the functional and behavioral views.** Maxted, A. Sandia National Labs., Albuquerque, NM (United States). Jun 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93040206. Source: OSTI; NTIS; GPO Dep.

An object-oriented methodology is presented that is based on two sets of Data Flow Diagrams (DFDs): one for the functional

view, and one for the behavioral view. The functional view presents the information flow between shared objects. These objects map to the classes identified in the structural view (e.g., Information Model). The behavioral view presents the flow of information between control components and relates these components to their state models. Components appearing in multiple views provide a bridge between the views. The top-down hierarchical nature of the DFDs provide a needed overview or road map through the software system.

34680 (SAND–93-0941) **A proposal for reverse engineering CASE tools to support new software development.** Maxted, A. Sandia National Labs., Albuquerque, NM (United States). Jun 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93040207. Source: OSTI; NTIS; GPO Dep.

Current CASE technology provides sophisticated diagramming tools to generate a software design. The design, stored internal to the CASE tool, is bridged to the code via code generators. There are several limitations to this technique: (1) the portability of the design is limited to the portability of the CASE tools, and (2) the code generators offer a clumsy link between design and code. The CASE tool though valuable during design, becomes a hindrance during implementation. Frustration frequently causes the CASE tool to be abandoned during implementation, permanently severing the link between design and code. Current CASE stores the design in a CASE internal structure, from which code is generated. The technique presented herein suggests that CASE tools store the system knowledge directly in code. The CASE support then switches from an emphasis on code generators to employing state-of-the-art reverse engineering techniques for document generation. Graphical and textual descriptions of each software component (e.g., Ada Package) may be generated via reverse engineering techniques from the code. These reverse engineered descriptions can be merged with system over-view diagrams to form a top-level design document. The resulting document can readily reflect changes to the software components by automatically generating new component descriptions for the changed components. The proposed auto documentation technique facilitates the document upgrade task at later stages of development, (e.g., design, implementation and delivery) by using the component code as the source of the component descriptions. The CASE technique presented herein is a unique application of reverse engineering techniques to new software systems. This technique contrasts with more traditional CASE auto code generation techniques.

34681 (SAND–93-1355C) **Information surety for today and tomorrow.** Fletcher, S.K. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930749–33: 34. annual meeting of the Institute of Nuclear Materials Management, Scottsdale, AZ (United States), 18-21 Jul 1993). Order Number DE93017647. Source: OSTI; NTIS; GPO Dep.

Information Surety is the enhancement of the confidentiality, integrity, and availability of information and software systems. It is attained through sequential steps: identification of software reliability requirements and information protection needs, designing for a balanced level of risk throughout the system, and application of appropriate software and hardware technologies and procedures. The ability to apply these steps when developing systems is impaired by a general lack of understanding of surety issues by system developers, and by the fact that there are many separate areas of knowledge involved that are not currently integrated into a disciplined approach (e.g., risk assessment, information access control in computers and networks, secure messaging, trusted software development). Our best systems today are achieved by clever designers who use ad-hoc methods. In the absence of good development tools, technologies may be applied haphazardly and/or retrofitted, without yielding balanced protection. This paper will take the audience through an exploration of the elements of information surety, some common misconceptions about information surety today, and the even greater challenges on the horizon. It will end with some suggestions for research areas which will help evolve the discipline of information surety.

34682 (SAND–93-1373) **GENSHELL: A genesis database 2D to 3D shell transformation program.** Sjaardema, G.D. Sandia National Labs., Albuquerque, NM (United States). Jul 1993. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93018694. Source: OSTI; NTIS; GPO Dep.

GENSHELL is a three-dimensional shell mesh generation program. The three-dimensional shell mesh is generated by mapping a two-dimensional quadrilateral mesh into three dimensions according to one of several types of transformations: translation, mapping onto a spherical, ellipsoidal, or cylindrical surface, and mapping onto a user-defined spline surface. The generated three-dimensional mesh can then be reoriented by offsetting, reflecting about an axis, revolving about an axis, and scaling the coordinates. GENSHELL can be used to mesh complex three-dimensional geometries composed of several sections when the sections can be defined in terms of transformations of two-dimensional geometries. The code GJOIN is then used to join the separate sections into a single body. GENSHELL updates the EXODUS quality assurance and information records to help track the codes and files used to generate the mesh. GENSHELL reads and writes two-dimensional and three-dimensional mesh databases in the GENESIS database format; therefore, it is compatible with the preprocessing, postprocessing, and analysis codes in the Sandia National Laboratories Engineering Analysis Code Access System (SEACAS).

34683 (SAND–93-1393C) **Applications of an algebraic Monge property.** Bein, W.W. (American Airlines Decision Technologies, Dallas/Fort Worth Airport, TX (United States)); Brucker, P.; Park, J.K. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306216–1: 3. Twente workshop on graphs and combinatorial optimization, Enschede (Netherlands), 2-4 Jun 1993). Order Number DE93016869. Source: OSTI; NTIS; GPO Dep.

When restricted to cost arrays possessing the sum Monge property, many combinatorial optimization problems with sum objective functions become significantly easier to solve. Examples include the usual sum-objective-function versions of the assignment problem, the transportation problem, the traveling-salesman problem, and several shortest-path problems. Furthermore, the more general algebraic assignment and transportation problems, which are formulated in terms of an ordered commutative semigroup $(H, *, \leq)$, are similarly easier to solve given cost arrays possessing the corresponding algebraic Monge property, which requires that for all $i < k$ and $j < \ell$, $a[i,j] * a[k,\ell] \leq a[i,\ell] * a[k,j]$. In this paper, we show that Monge-array results for two sum-of-edge-costs shortest-path problems can likewise be extended to a general algebraic setting, provided the problems' ordered commutative semigroup $(H, *, \leq)$ satisfies one additional restriction. We also show how our algorithms can be modified to solve certain bottleneck shortest-path problems, even though the ordered commutative semigroup $(\Re, \max, \leq)$ naturally associated with bottleneck problems does not satisfy our additional restriction. We also provide improved algorithms for several other bottleneck combinatorial optimization problems whose cost arrays possess the strict bottleneck Monge property. Finally, we show how our bottleneck shortest-path techniques can be used to obtain fast algorithms for a variant of Hirschberg and Larmore's optimal paragraph formation problem, a processor-allocation problem first formulated by Bokhari, and a special case of the bottleneck traveling-salesman problem.

34684 (SOL–93-4) **On the numerical stability of quasi-definite systems.** Gill, P.E. (Univ. of California, San Diego, La Jolla, CA (US). Dept. of Mathematics); Shinnerl, J.R.; Saunders, M.A. Stanford Univ., CA (United States). Systems Optimization Lab. Jun 1993. 9p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract FG03-92ER25117. Grant DDM-9204208;Grant DDM-9204547;Grant N00014-90-J-1242. Order Number DE93019404. Source: OSTI; NTIS; GPO Dep.

The authors discuss the solution of sparse linear equations $Kd = r$, where K is a symmetric and specially structured indefinite matrix

that often arises in numerical optimization. For such K, the indefinite factorization $K = LDL^T$ is known to exist in exact arithmetic with 1 x 1 pivots and no row or column interchanges. It is shown that the stability of the LDL^T factorization of this matrix is naturally connected with the stability of the LDM^T factorization of a closely related unsymmetric positive-definite matrix. Conditions are given that allow the stable numerical solution of this system by Gaussian elimination without row and column interchanges.

34685 (SOL–93-5) **The simplex algorithm with a new primal and dual pivot rule.** Chen, Hsin-Der (Florida Univ., Gainesville, FL (United States). Dept. of Industrial and Systems Engineering); Pardalos, P.M.; Saunders, M.A. Stanford Univ., CA (United States). Systems Optimization Lab. Jun 1993. 9p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract FG03-92ER25117. Grant DDM-8814075;Contract STC-91-19999;Grant DDM-9204208;Grant Order Number DE93019401. Source: OSTI; NTIS; GPO Dep.

We present a simplex-type algorithm for linear programming that works with primal-feasible and dual-feasible points associated with bases that differ by only one column.

34686 (SSCL–628) **Data-machine Independence (DMI).** Botlo, M.; Jagielski, M.; Miller, L.; Romero, A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93018008. Source: OSTI; NTIS; GPO Dep.

A distributed data acquisition system (DAQ) should not restrict the number or type of processors used in a given application. For any software applications that must operate on a multi-vendor distributed system, three serious problems have to be addressed regarding data handling: data representation, memory organization, and address alignment. Data representation, memory organization, and address alignment problems are inherent in the various hardware platforms available on the market today. Furthermore, issues such as how to coordinate parallel software efforts on multiple platforms that share data must be resolved. Traditionally such efforts are coordinated through meetings, memos, and documents describing shared data blocks (Data Interface Documents). The traditional approach is risky at best: the frequency of changes demanded by end-users is faster than the rate at which interface documents can be updated. Simple changes in data structures tend to dramatically increase the software development time, as all the tools must be modified to accommodate the changes. In Section 2.0 the authors examine in detail the technical implications for data handling when using distributed applications. In Section 3.0 they compare different approaches in handling the data in distributed environments. The four methods studied are: (1) Abstract Syntax Notation 1 (ASN.1), (2) External Data Representation (XDR), (3) Self Describing Data Format (SDS), and (4) ZEBRA. They compared the four tools with the standard programming method (using "C"). In Section 4.0 they present conclusions of the test using the four different tools.

34687 (UCRL-ID–114259) **A program for passively tracking a target using an array of sensors.** Buhl, M.R. Lawrence Livermore National Lab., CA (United States). Jan 1993. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93019554. Source: OSTI; NTIS; GPO Dep.

The problem of passively tracking a moving signal source has importance in a variety of applications such as radar, sonar, seismology, and radio astronomy. In many applications, only limited information is available about the signal source. It will be assumed here that only the signals which are detected by the sensors and the velocity of the source signal are known. The objective of this document is to present a program which passively tracks a target using an array of sensors. This program is available in MATLAB, version 3.5. The algorithm which is implemented consists of three main parts: time delay estimation, passive localization, and data post processing. Each of these parts are discussed, and the mathematical foundation for their solution given. Following, this the organization of the program is presented, and an example of its usage is given.

34688 (UCRL-JC–112573) **High Performance Fortran: An overview.** Zosel, M.E. Lawrence Livermore National Lab., CA (United States). 23 Dec 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9302135–1: Institute for Electronic and Electrical Engineers (IEEE) COMPON spring meeting, San Francisco, CA (United States), 22-26 Feb 1993). Order Number DE93017181. Source: OSTI; NTIS; GPO Dep.

The purpose of this paper is to give an overview of the work of the High Performance Fortran Forum (HPFF). This group of industry, academic, and user representatives has been meeting to define a set of extensions for Fortran dedicated to the special problems posed by a very high performance computers, especially the new generation of parallel computers. The paper describes the HPFF effort and its goals and gives a brief description of the functionality of High Performance Fortran (HPF).

34689 (UCRL-JC–112716) **The "Pen" penetration analysis code: Comparison with experiments and with CALE calculations.** Simonson, S.C. III. Lawrence Livermore National Lab., CA (United States). Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-931121–11: Annual winter meeting of the American Society of Mechanical Engineers, New Orleans, LA (United States), 28 Nov - 3 dec 1993). Order Number DE93017194. Source: OSTI; NTIS; GPO Dep.

The "Pen" computer program has been developed for the analysis of penetration by shaped charge jets. In addition to standard methods for calculating the depth of penetration and the radius of the hole produced by a stretching jet, Pen contains new methods for treating the onset of particulation and for calculating the depth of penetration by a particulated jet. A Pen analysis was compared with a detailed calculation carried out with the LLNL Arbitrary Lagrangian-Eulerian code CALE. Pen was also applied to the analysis of two shaped charge jet penetration experiments. Pen reproduced the CALE hole profile and the experimental profiles when the effective strength in the steel targets was set to 1.2–1.3 times the yield strength. An experimental value of 1.44 ± 0.19 GPa was obtained for the effective strength of hardened A4340 steel under jet impact.

34690 (UCRL-JC–113561) **Automated call tracking systems.** Hardesty, C. Lawrence Livermore National Lab., CA (United States). Mar 1993. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303131–2-Vugraphs: Cray Users Group conference, Montreaux (Switzerland), 29 Mar - 2 apr 1993). Order Number DE93017994. Source: OSTI; NTIS; GPO Dep.

Includes vugraphs.

User Services groups are on the front line with user support. We are the first to hear about problems. The speed, accuracy, and intelligence with which we respond determines the user's perception of our effectiveness and our commitment to quality and service. To keep pace with the complex changes at our sites, we must have tools to help build a knowledge base of solutions, a history base of our users, and a record of every problem encountered. Recently, I completed a survey of twenty sites similar to the National Energy Research Supercomputer Center (NERSC). This informal survey reveals that 27% of the sites use a paper system to log calls, 60% employ homegrown automated call tracking systems, and 13% use a vendor-supplied system. Fifty-four percent of those using homegrown systems are exploring the merits of switching to a vendor-supplied system. The purpose of this paper is to provide guidelines for evaluating a call tracking system. In addition, insights are provided to assist User Services groups in selecting a system that fits their needs.

34691 (UCRL-JC–113626) **Texture splats for 3D vector and scalar field visualization.** Crawfis, R.A.; Max, N. Lawrence Livermore National Lab., CA (United States). 6 Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-931080–3: Visualization '93, San Jose, CA (United States), 25-29 Oct 1993). Order Number DE93017104. Source: OSTI; NTIS; GPO Dep.

Volume Visualization is becoming an important tool for understanding large 3D datasets. A popular technique for volume

rendering is known as splatting. With new hardware architectures offering substantial improvements in the performance of rendering texture mapped objects, we present textured splats. An ideal reconstruction function for 3D signals is developed which can be used as a texture map for a splat. Extensions to the basic splatting technique are then developed to additionally represent vector fields.

34692 (UCRL-JC–113823) **Two-dimensional particle-in-cell simulation on transputer arrays.** Dyachenko, A.I. (Landau Inst. of Theoretical Physics, Moscow (RU)); Pushkarev, A.N.; Laypunov, M.A.; Talnykin, E.A.; Omelchenko, Yu.A.; Rubenchik, A.M. Lawrence Livermore National Lab., CA (United States). 3 May 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-931115–8: Supercomputing conference on high performance computing and communications, Portland, OR (United States), 15-19 Nov 1993). Order Number DE93017977. Source: OSTI; NTIS; GPO Dep.

The authors have implemented a particle-in-cell method on a 32 transputer computing network. The tests have shown that the performance of this system reaches 1/8 of the equivalent one for the code optimized for a CRAY Y-MP/2E. The system performance analysis shows that this network remains cost-effective until expanded approximately up to 100 transputers. This transputer equipment has provided an efficient computational tool for investigating a novel physical phenomenon – a collisionless mechanism for separation of different elements in colliding plasma beams.

34693 (UCRL-JC–113858) **Performance and scalability aspects of directory-based cache coherence in shared-memory multiprocessors.** Picano, S. (Purdue Univ., Lafayette, IN (United States). School of Electrical Engineering); Meyer, D.G.; Brooks, E.D. III; Hoag, J.E. Lawrence Livermore National Lab., CA (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9308129–1: 22. annual international conference on parallel processing, University Park, PA (United States), 16-20 Aug 1993). Order Number DE93016442. Source: OSTI; NTIS; GPO Dep.

We present a study that accentuates the performance and scalability aspects of directory-based cache coherence in multiprocessor systems. Using a multiprocessor with a software-based coherence scheme, efficient implementations rely heavily on the programmer's ability to explicitly manage the memory system, which is typically handled by hardware support on other bus-based, shared memory multiprocessors. We describe a scalable, shared memory, cache coherent multiprocessor and present simulation results obtained on three parallel programs. This multiprocessor configuration exhibits high performance at no additional parallel programming cost.

34694 (UCRL-JC–113874) **Automated assistance for detecting malicious code.** Crawford, R. (Univ. of California, Davis, CA (US). Dept. of Computer Science); Kerchen, P.; Levitt, K.; Olsson, R.; Archer, M.; Casillas, M. Lawrence Livermore National Lab., CA (United States). 18 Jun 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018106. Source: OSTI; NTIS; GPO Dep.

This paper gives an update on the continuing work on the Malicious Code Testbed (MCT). The MCT is a semi-automated tool, operating in a simulated, cleanroom environment, that is capable of detecting many types of malicious code, such as viruses, Trojan horses, and time/logic bombs. The MCT allows security analysts to check a program before installation, thereby avoiding any damage a malicious program might inflict.

34695 (UCRL-JC–113875) **The new SPI: More refined and integrated system checks.** Taylor, S.M.H. Lawrence Livermore National Lab., CA (United States). May 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9310103–1: 4. USENIX UNIX security symposium, Santa Clara, CA (United States), 4-7 Oct 1993). Order Number DE93016429. Source: OSTI; NTIS; GPO Dep.

Current research and development at Lawrence Livermore National Laboratory will soon provide the system/security administrator a new set of tools ranging from monitors and intrusion detection to sensitive information detectors. However, the full potential of both existing and future tools will not be realized until a complimentary set of utilities has been integrated into a single computer security workbench in which the results from one process can be used as input to another. The Security Profile Inspector (SPI), a UNIX and VMS security profiler, has taken the first step toward providing this integration. This is accomplished by using an interpreted query language which allows specific, general, and even recursive queries of system configuration information. The new SPI is extremely flexible, so that users can easily tailor existing checks for their system or even add new checks. Similarly, other tools can ask specific questions, for example limiting their inquiries to a single user or a list of users which meet certain criteria. Furthermore, the query language was designed to support multiple architectures and operating systems and to ease the transition of tools to new platforms.

34696 (UCRL-MA–113603) **CAVEMAN: Configuration And VErsion MANagement: User's guide, v2.1.2.** Dyer, K.M. Lawrence Livermore National Lab., CA (United States). 12 Mar 1993. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93018066. Source: OSTI; NTIS; GPO Dep.

The mission of the CAVEMAN project is to provide the tools for large code systems so that those who work on them can perform source control and configuration control on UNIX-based file servers, rather than the LC Crays. An outside product called cvs has been chosen as the underlying source control system. The initials stand for "Concurrent Versions System". It is a freeware program that runs on most UNIX stations. To quote from the cvs man page: "cvs is a front end to the rcs revision control system which extends the notion of revision control from a collection of files in a single directory to a hierarchical collection of directories consisting of revision controlled files. These directories and files can be combined together to form a software release. cvs provides the functions necessary to manage these software releases and to control the concurrent editing of source files among multiple software developers." While cvs may be run directly, there are several tasks in the LLNL environment that it seemed either safer or easier to automate. CAVEMAN provides the needed functionality, generally in the form of wrappers to cvs.

34697 (ANL/MCS/CP–80152) **Restricting query relaxation through user constraints.** Gaasterland, T. Argonne National Lab., IL (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305242–1: International conference on intelligent and cooperative information systems, Rotterdam (Netherlands), 11-14 May 1993). Order Number DE93017413. Source: OSTI; NTIS; GPO Dep.

This paper describes techniques to restrict and to heuristically control relaxation of deductive database queries. The process of query relaxation provides a user with a means to automatically identify new queries that are related to the user's original query. However, for large databases, many relaxations may be possible. The methods to control and restrict the relaxation process introduced in this paper focus the relaxation process and make it more efficient. User restrictions over the data base domain may be expressed as user constraints. This paper describes how user constraints can restrict relaxed queries. Also, a set of heuristics based on cooperative answering techniques are presented for controlling the relaxation process. Finally, the interaction of the methods for relaxing queries, processing user constraints, and applying the heuristic rules is described.

34698 (CONF-931148–1) **An ORACLE CASE history: Experiences with ORACLE CASE tools.** Faby, E.Z. (Tennessee Univ., Knoxville, TN (United States)); Hancock, B.R.; Truett, L.F. Oak Ridge National Lab., TN (United States). 16 Feb 1993. 15p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Agreement 1405-1351-A1. From 17. annual international computer software and applications conference (COMPSAC93); Phoenix, AZ (United States); 3-5 Nov 1993.

Order Number DE93010827. Source: OSTI; NTIS (US Sales Only); GPO Dep.

ORACLE CASE tools were used with limited success during development of a database system for the Army. During project development, the set of tools was used for analysis, design, database implementation, and documentation. The CASE tools provided an acceptable user interface for data entry and data correction; they provided standardized reports and views from which data for customized reports could be extracted. However, they had a number of limitations that significantly increased the effort required to maintain and use the CASE data in each phase of development. In particular, the CASE tools were especially limited in essential functions for modifying the system analysis and design. In addition, a decision was made during system development to change to a different version of the ORACLE Relational Database Management System (RDBMS), thus further reducing the value of the CASE tools.

34699 (DOE–93017197) **Trends in Information Management at Department of Energy Headquarters.** USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Technology Services and Operations. Jun 1993. 55p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93017197. Source: OSTI; NTIS; GPO Dep.

The Trends in Information Resource Management at DOE Headquarters (Trends) is published annually to inform the DOE Headquarters community about changes in the information management environment. The document, in its second year of publication, is becoming more robust as more historical data is available and as the information management environment at Headquarters evolves. One of the purposes of the Trends document is to acquire evidence that Headquarters organizations are assimilating guidance offered in the Emerging Technologies Planning Guide into their IRM strategies. Another purpose is to identify areas of interest and requirements of the Headquarters organizations to direct technology research for future issues of the Guide. These categories have been tentatively established as indicators of the degree of implementation of information management. The main source of data is the Headquarters Organization Plans, which were updated during the long-range update cycle conducted from August to January. Since these plans were published, the Secretary has announced a reorganization of DOE. For the purpose of this document, the information in the various plans is considered to be valid to accomplish the Departmental missions.

34700 (DOE/FTR–93018986) **Travel to Japan to attend the meeting of ISO JTC1 SC21 and its working groups: Foreign trip report, June 12–30, 1993.** Smith, M.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. 6 Aug 1993. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93018986. Source: OSTI; NTIS (US Sales Only); GPO Dep.

I attended three related meetings in Yokohama as a US delegate. They were the June 29–30 meeting the SC21 Plenary, the June 15–25 meeting of SC21/WG8, and the June 16–24 meeting of the SC21 Special Working Group on Modelling Facilities. I summarize and report the details of each group separately.

34701 (ENEA-RT-INN–92-34) **ALGO 2.** Vaccari, M. (ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione); Visparelli, D.; Sola, P.G. Dec 1992. 83p. (In Italian). (RT/INN–92-34). Order Number DE93522945. Source: OSTI; NTIS (US Sales Only).

This report describes a prototype of an on-line documentation and access system to the mathematical, statistical and graphical software managed in the framework of the ENEA (Italian Agency for Energy, New Technologies and the Environment) Algorithms Library. The System, based on a tree structure realized using a set of full-screen menus, is available on the IBM 3090/VF of Bologna Center connected to the ENEA network. The software product IBM-ISPF (Interactive System Facility) was used for building the screen menus.

34702 (ORNL/CDIAC–62) **CDIAC catalog of numeric data packages and computer model packages.** Boden, T.A. (Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center); O'Hara, F.M. Jr.; Stoss, F.W. Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. May 1993. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93017675. Source: OSTI; NTIS; INIS; GPO Dep.

The Carbon Dioxide Information Analysis Center acquires, quality-assures, and distributes to the scientific community numeric data packages (NDPs) and computer model packages (CMPs) dealing with topics related to atmospheric trace-gas concentrations and global climate change. These packages include data on historic and present atmospheric CO_2 and CH_4 concentrations, historic and present oceanic CO_2 concentrations, historic weather and climate around the world, sea-level rise, storm occurrences, volcanic dust in the atmosphere, sources of atmospheric CO_2, plants' response to elevated CO_2 levels, sunspot occurrences, and many other indicators of, contributors to, or components of climate change. This catalog describes the packages presently offered by CDIAC, reviews the processes used by CDIAC to assure the quality of the data contained in these packages, notes the media on which each package is available, describes the documentation that accompanies each package, and provides ordering information. Numeric data are available in the printed NDPs and CMPs, in CD-ROM format, and from an anonymous FTP area via Internet. All CDIAC information products are available at no cost.

34703 (ORNL/FTR–4620) **Travel to England for meetings on international standards for information technology: Foreign trip report, April 28–May 18, 1993.** Mason, J.D. Oak Ridge National Lab., TN (United States). 1 Jun 1993. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014862. Source: OSTI; NTIS (US Sales Only); GPO Dep.

As DOE seeks to move towards electronic production, management, and dissemination of scientific and technical information and the adoption of government and international standards to support that effort, it has for several years been involved in the development of international standards for text preparation and interchange. In support of this effort, the traveler serves as Convenor of ISO/IEC JTC1/SC18/WG8; during this trip he convened the Spring 1993 meeting of WG8 in Exeter, England, and then represented WG8 at the annual Plenary of SC 18, the committee including WG8, in London, England.

34704 (PNL-SA–22358) **Lessons learned in procuring a laser optical disk system.** Berndt, V.L. Pacific Northwest Lab., Richland, WA (United States). May 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93018785. Source: OSTI; NTIS; GPO Dep.

This paper describes an effort to procure an optical disk storage system for the Hanford Radiological Records Program. The project manager evaluated technologies available and compatible to the existing computers. A feasibility study was initiated that incorporates special needs and system costs. A requirements analysis, system design, vendor selection and system implementation and testing are documented. Recommendations applicable to procurement in general are given.

34705 (SAND–93-1701C) **Networked MS Windows 3.1 based Classified Document Control System (CDOCS).** Desonier, L.M. Sandia National Labs., Albuquerque, NM (United States). 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930749–16: 34. annual meeting of the Institute of Nuclear Materials Management, Scottsdale, AZ (United States), 18-21 Jul 1993). Order Number DE93017880. Source: OSTI; NTIS; GPO Dep.

Current classified document management systems require a tremendous amount of space and extensive manpower to account for, inventory, and protect the documents. Comprehensive analysis of current control and accountability procedures reveal the main problem is the actual handling of the paper itself. The purpose of the Networked Microsoft Windows 3.1 based Classified Document Control System (CDOCS) is to eliminate the paper by scanning and storing images of pages on a personal computer using "write once read mostly" (WORM) high density optical media. By saving

images on the computer, not only can manpower and space requirements be reduced, but the chance of compromise is diminished. As an added benefit, the information is now more readily available to the authorized user and is provided to the user at the user's PC. The network target for CDOCS is Microsoft Windows for Workgroups. Thus, the system is also readily applicable to unclassified document imaging uses.

34706 (SAND–93-1721C) **Understanding requirements via natural language information modeling.** Sharp, J.K.; Becker, S.D. Sandia National Labs., Albuquerque, NM (United States). 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930749–12: 34. annual meeting of the Institute of Nuclear Materials Management, Scottsdale, AZ (United States), 18-21 Jul 1993). Order Number DE93017875. Source: OSTI; NTIS; GPO Dep.

Information system requirements that are expressed as simple English sentences provide a clear understanding of what is needed between system specifiers, administrators, users, and developers of information systems. The approach used to develop the requirements is the Natural-language Information Analysis Methodology (NIAM). NIAM allows the processes, events, and business rules to be modeled using natural language. The natural language presentation enables the people who deal with the business issues that are to be supported by the information system to describe exactly the system requirements that designers and developers will implement. Computer prattle is completely eliminated from the requirements discussion. An example is presented that is based upon a section of a DOE Order involving nuclear materials management. Where possible, the section is analyzed to specify the process(es) to be done, the event(s) that start the process, and the business rules that are to be followed during the process. Examples, including constraints, are developed. The presentation steps through the modeling process and shows where the section of the DOE Order needs clarification, extensions or interpretations that could provide a more complete and accurate specification.

34707 (UCRL-JC–112556) **Applying IEEE storage system management standards at the National Storage Laboratory.** Louis, S.; Hyer, S.W. Lawrence Livermore National Lab., CA (United States). 4 Dec 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930461–5: 12. IEEE symposium on mass storage systems, Monterey, CA (United States), 25 Apr 1993). Order Number DE93018082. Source: OSTI; NTIS; GPO Dep.

Since its inception in 1990, the IEEE Storage System Standards Working Group has identified storage-system management as an area in need of further development The pressing need for standards in storage-system management arises from the requirement to exchange management information and to provide control in a consistent predictable manner between the components of a storage system. An appropriate set of management standards will allow multiple vendors to supply storage management subsystems or applications that are integral to or compatible with new storage systems conforming to future IEEE standards. An early, practical application of IEEE storage-system-management work is being pursued at the National Storage Laboratory (NSL), a recently-formed industrial collaboration at Lawrence Livermore National Laboratory. The NSL's purpose is to develop advanced hardware and software technologies for high-performance, distributed storage systems. Since storage system management is of critical concern, it is being explored in depth at the NSL. Work was initiated to define basic management requirements and develop generalized graphical-user-interface tools using remote-procedure-call mechanisms to implement the NSL's conceptual management framework. Several constraints were imposed on the development of early versions of this work to maintain compatibility with the NSL's underlying UniTree-based software architecture and to provide timely prototypes and proof of concept. The project leverages the on-going standards work of the IEEE Storage System Standards Working Group (SSSWG) and also explores some of the relationships and interactions between IEEE storage-system management and more well known management methods for distributed systems and networks. It will have long term benefits by providing "real-life" storage-system-management requirements to the IEEE SSSWG for validation of evolving standards.

34708 (WSRC-TR–92-433) **Data Qualification guidelines: Task number 90-053-0.** Edwards, T.B.; Shine, E.P. Westinghouse Savannah River Co., Aiken, SC (United States). 2 Sep 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93019281. Source: OSTI; NTIS; INIS; GPO Dep.

Data Qualification (DQ) is a formal, technical process whose objective is to affirm that experimental data are suitable for their intended use. Although it is not possible to develop a fixed recipe for the DQ process to cover all test situations, these general guidelines have been developed for the Nuclear Engineering Section to establish a framework for qualifying data from steady-state processing. These guidelines outline the role of the DQ team providing insight into the planning and conducting of the DQ process.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3, *International Energy: Research Organizations 1986–1990*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

^{11}Li(29 MeV/nucleon) elastic scattering on silicon nuclei, 18:34350 (RA;RU;In Russian)
^{162}Dy studied with the (d,p), (d,t), (n,γ) and (n,n'γ) reactions, 18:34083 (RA;RU)
^{178m2}Hf exotic nucleus-target and heavy ion reactions, 18:34353 (RA;RU;In Russian)
^{241}Am decay, 18:34218 (RA;RU;In Russian)
^{25}Mg(d,^{6,7}Li) reaction at E_d=13.6 MeV, 18:34331 (RA;RU;In Russian)
(α,xn) reactions on ^{124}Sn isotope, 18:34326 (RA;RU;In Russian)
(π^-,-x) and (π^-,2px) reactions on C,N,O and Ag, Br at energy of 170 MeV, 18:34283 (RA;RU;In Russian)
102-element isotope production in the ^{32}Ne+^{236}U and ^{26}Mg+^{232}Th reactions, 18:34346 (RA;RU;In Russian)
444.6 keV-isomeric transition in ^{152}Gd, 18:34170 (RA;RU;In Russian)
Activation analysis of isotope-enriched substance of ytterbium-176, 18:33298 (RA;RU;In Russian)
Activation determination of C, N and O in mercury diiodide crystals, 18:33297 (RA;RU;In Russian)
Activation of aluminium foils by ^{4}He ions with 25-45 MeV energies, 18:34336 (RA;RU;In Russian)
Alagi rules violation in transitions between the 9/2$^+$(624) and 7/2$^-$(514) band levels in ^{177}Hf, 18:34182 (RA;RU;In Russian)
Alpha decay of ^{156}Er, 18:34172 (RA;RU;In Russian)
Alpha-, beta- and proton stability of mean and heavy nuclei, 18:34207 (RA;RU;In Russian)
Alpha-particle scattering by ^{50}Ti at 40 and 50 MeV energies, 18:34337 (RA;RU;In Russian)
Analysis and estimation of photonuclear reactions on copper isotopes, 18:34292 (RA;RU;In Russian)
Analysis of depth profile of oxygen distribution in HTSC-films using nuclear reaction ^{16}O(d,α)^{14}N, 18:33227 (RA;RU;In Russian)
Analysis of excitation functions of reactions induced by alpha particles on ^{116,117,118,120,124}Sn at 13-24.4 MeV energies, 18:34334 (RA;RU;In Russian)
Analysis of the angular correlation function in the massive transfer reactions in the frame of direct and statistical approaches, 18:34392 (RA;RU;In Russian)
Analysis of time characteristics of the excited actinide nucleus decay using of phenomenological model of level density, 18:34214 (RA;RU;In Russian)
Angular dependence of the ^{6}Li(2.18 MeV, 3$^+$) nucleus polarization in the 80 MeV α-particles inelastic scattering, 18:34253 (RA;RU;In Russian)
Angular distribution of γ-quanta produced in M1-resonance decay calculated from the first excited state of ^{34}Cl, 18:34209 (RA;RU;In Russian)
Angular distribution of internal bremsstrahlung quanta from beta decay of polarized nuclei, 18:34202 (RA;RU;In Russian)
Angular momentum of compound nuclei in the heavy ion near-barrier fusion reactions, 18:34401 (RA;RU;In Russian)
Application of the nuclear backscattering method for measurement of the proton stopping cross sections in the 80-240 keV energy range, 18:34420 (RA;RU;In Russian)
Attenuation of nuclear zerosound as a delayed effect in kinetic equation, 18:34118 (RA;RU;In Russian)
Autoionization of K shell in β-decay of ^{170}Tm, 18:34176 (RA;RU;In Russian)
Backward scattering in the region of the deep rainbow shadow, 18:34314 (RA;RU)
Bremsstrahlung of polarized electrons in case of fixed energy transferred to nucleus, 18:34256 (RA;RU;In Russian)
Calculation of isomer ratios in the ^{130}Te(αn)^{133}Xe, ^{136}Ce(αn)^{139}Nd, ^{175}Lu(αn)^{178}Ta and ^{194}Pt(αn)^{197}Hg reactions, 18:34340 (RA;RU;In Russian)
Calculation of relative probabilities of atomic electron capture by nucleus, 18:34203 (RA;RU;In Russian)
Calculation of scattering NN-phase by phase function method, 18:34224 (RA;RU;In Russian)
Calculation of the semiconductor detector-dosimeter characteristics, 18:33676 (RA;RU;In Russian)
Capability of nuclear microanalysis for determination of microelements content in patients with dermatities from regions with favorable and unfavorable radiation situation, 18:33300 (RA;RU;In Russian)
Cascades of γ-transitions of the ^{143}Nd compound state decay, 18:34166 (RA;RU;In Russian)
Caustic features of wave function of the light ion elastic scattering, 18:34231 (RA;RU;In Russian)
Change of quasiparticle vacuum properties in aligned multiphonon bands, 18:34123 (RA;RU;In Russian)
Charged particle emission during slow negative pion absorption by uranium nuclei, 18:34288 (RA;RU;In Russian)

Charged particle scattering on isotones, 18:34189 (RA;RU;In Russian)
Cluster radioactivity of nuclei with A<208, 18:34193 (RA;RU;In Russian)
Coherent photoproduction of postulated neutral particle in crystals, 18:34047 (RA;RU;In Russian)
Collective excitation mechanism in α-particle inelastic scattering by ^{12}C nuclei at E_α=25 MeV, 18:34320 (RA;RU;In Russian)
Common potential of hadron-nuclear interaction at particle energies $\leq$1 GeV in kinematically corrected impulse approximation, 18:34369 (RA;RU;In Russian)
Comparative description pA and p-barA scattering under diffraction scaling conditions, 18:34372 (RA;RU;In Russian)
Comparison of two examples of a generalized optical model in the analysis of neutron cross sections for Te, 18:34273 (RA;RU;In Russian)
Competition of the nucleon quasi-free knockout by mean-energy antinucleons and antinucleon annihilation in nuclei, 18:34366 (RA;RU;In Russian)
Connection of macroscopic and microscopic approaches to the description of the double nuclear system dynamics, 18:34389 (RA;RU;In Russian)
Consistent calculation of polarized electric dipole moment by shell correction method, 18:34121 (RA;RU;In Russian)
Construction of the effective NN-potential on data for the light, intermediate and heavy nuclei, 18:34102 (RA;RU;In Russian)
Conversion electron spectrum of 1.56 keV transition in ^{201}Hg, 18:34198 (RA;RU;In Russian)
Correlation method for study on nonbound states of nuclei in multiparticle heavy ion reactions, 18:34351 (RA;RU;In Russian)
Coulomb excitation of E1 and E2 transitions in ^{19}F nucleus of LiF crystal by protons and antiprotons, 18:34476 (RA;RU;In Russian)
Cross section of the ^{113}In (γ,2n) $^{111m,g}In$ reactions, 18:34305 (RA;RU;In Russian)
Cross sections for the (p,γ0,1,2) reaction on ^{65}Cu near the threshold of neutron emission, 18:34259 (RA;RU;In Russian)
Cross sections of (p,X)-reactions in molibdenum target at E_p=660 MeV, 18:34219 (RA;RU;In Russian)
Cross sections of radioisotopes production in the silver target irradiated by protons with 660 MeV energy, 18:34404 (RA;RU;In Russian)
CsI(Tl) film scintillation of large area, 18:33658 (RA;RU;In Russian)
Data analysis on ^{3}He elastic and inelastic scattering at low and mean energies on nuclei with 40<A<124, 18:34338 (RA;RU;In Russian)
Decay of ^{143}Tb (60 min), 18:34169 (RA;RU;In Russian)
Decay scheme of ^{93}Mo, 18:34072 (RA;RU;In Russian)
Dependence of muon EO conversion probability on nuclear models, 18:34450 (RA;RU;In Russian)
Dependence of nucleon-nucleus interaction cross section on momentum distribution of nucleons in the nucleus-target, 18:34379 (RA;RU;In Russian)
Description of hadron-hadron interaction on the base of P-matrix approach, 18:34046 (RA;RU;In Russian)
Description of properties of finite final nuclei and nucleon-nucleus potentials on the base of NN potentials of the mesonic theory, 18:34103 (RA;RU;In Russian)
Description of properties of the neutron-rich nuclei in the hyperspherical function method, 18:34104 (RA;RU;In Russian)
Detecting modulus on the silicon position sensitive detectors for the VASILISA separator, 18:33660 (RA;RU;In Russian)
Detection method in environment of hot particles as products of accident on the Chernobyl nuclear power plant, 18:33667 (RA;RU;In Russian)
Detection of light charged particles by scintillation phosphich detector, 18:33657 (RA;RU;In Russian)
Determination of concentration profile of titanium using reaction $^{48}Ti(p,\gamma)^{49}V$, 18:33303 (RA;RU;In Russian)
Determination of correcting slowing-down factors of Ru in Mo for the alpha reactions, 18:34074 (RA;RU;In Russian)
Determination of electric field gradient in palladium hydrides by ^{60}Co impurity nuclei orientation method, 18:34466 (RA;RU;In Russian)
Determination of k capture probabilities for decay of ^{75}Se, 18:34157 (RA;RU;In Russian)
Deuteron stripping reaction at intermediate energies, 18:34223 (RA;RU;In Russian)
Differential cross sections of neutron scattering with energy of 70-400 keV and middle parameters of neutron resonances for $^{110,113,116}Cd$, 18:34285 (RA;RU;In Russian)
Diffractive structure of pion spectrum in ion-ion collisions, 18:34355 (RA;RU;In Russian)
Dipole giant resonance over the first excited state of ^{12}C, 18:34297 (RA;RU;In Russian)
Direct nucleon decay of giant resonances, 18:34122 (RA;RU;In Russian)
Distribution of octupole force in deformed nuclei up to 6 MeV energy, 18:34116 (RA;RU;In Russian)
Distribution oven states of M2-transition forces in odd nuclei of p shell, 18:34190 (RA;RU;In Russian)
Double nuclear system as the initial state for compound nucleus production - new mechanism of heavy nuclear system fusion: Model, 18:34229 (RA;RU;In Russian)
Double nuclear system as the initial state for compound nucleus production - new mechanism of heavy nuclear system fusion: Comparison with the experiment, 18:34230 (RA;RU;In Russian)
Duration of compound reactions in frameworks of random matrix model, 18:34222 (RA;RU;In Russian)
E1-radiative decay of analog resonance in ^{35}Cl, 18:34210 (RA;RU;In Russian)
E1-radiative strength functions in 'heated' deformed nuclei, 18:34137 (RA;RU;In Russian)
Effect of angular momentum on mass and energy distributions of fission fragments, 18:34348 (RA;RU;In Russian)
Effect of four quasi-particle configurations and correlations in ground state on the lowest 2^+-state energy, 18:34138 (RA;RU;In Russian)
Effective account of hexadecupole modes in the nuclear collective model with dynamical quadrupole deformations, 18:34110 (RA;RU;In Russian)
Effective Hamiltonian of interaction of quasiparticles with core quadrupole excitations, 18:34126 (RA;RU;In Russian)
Effective potentials and the equation of the hypernuclear matter state, 18:34151 (RA;RU;In Russian)
Effects of non-zero mass, electromagnetic interactions and helicity of neutrino in elastic neutrino (antineutrino) -electron scattering, 18:34044 (RA;RU;In Russian)
Effects of radiation-stimulated improvement of the metal-semiconductor interface quality, 18:33691 (RA;RU;In Russian)
Elastic scattering ^{12}C ^{4}He,$^{4}He^{12}CV$ at E_α=72 and 81 MeV, 18:34310 (RA;RU;In Russian)
Elastic scattering and breakup of weakly coupled particles in adiabatic approximation, 18:34373 (RA;RU;In Russian)
Elastic scattering of antiprotons on ^{4}He nucleus, 18:34357 (RA;RU;In Russian)
Elastic scattering of antiprotons by ^{12}C and ^{16}O nuclei and α-cluster model with dispersion, 18:34371 (RA;RU;In Russian)
Elastic scattering of $p^{11}Li$ at intermediate energies, 18:34280 (RA;RU;In Russian)
Electron capture-to-positron emission for decay of ^{58}Co and ^{74}As, 18:34156 (RA;RU;In Russian)
Electrostatic charge-exchange accelerator for investigations on the nuclear spectroscopy and structure, 18:33477 (RA;RU;In Russian)
Emission of α-particles and nucleons in deuteron interaction with Zr nuclei, 18:34324 (RA;RU;In Russian)
Emission of fast positrons and electrons in ion-ion collisions at intermediate energies, 18:34356 (RA;RU;In Russian)
Energy dependence of isomer ratios in the $^{116}Sn(d,n)^{119m,g}Te$, $^{117}Sn(\alpha,2n)^{119m,g}Te$, $^{118}Sn(d,n)^{121m,g}Te$ reactions, 18:34335 (RA;RU;In Russian)
Energy dependence of proton slowing-down cross section in high-Tc superconductor, 18:34479 (RA;RU;In Russian)
Energy dependence pf (antip,p')-scattering on Si with excitation of 2^+ and 3^- (T=0) states, 18:34262 (RA;RU;In Russian)
Estimation of (A,Z)(ν_e,e^-)(A,Z+1) reaction cross section, 18:34255 (RA;RU;In Russian)
Estimation of probability for the two-photon decay of the ^{137}Ba 662 keV isomeric state, 18:34205 (RA;RU;In Russian)

Estimation of the (n,n') reaction cross sections on ^{208}Pb nucleus, 18:34381 (RA;RU;In Russian)
Exchange correlation function and surface effects, 18:34232 (RA;RU;In Russian)
Excitation cross-section of L-shell characteristic X-rays of neptunium by protons, 18:34419 (RA;RU;In Russian)
Excitation functions for the ^{22,24}Na and ^{7}Be isotopes in ^{3}He ion interaction with Si nuclei at energies up to 95 MeV, 18:34322 (RA;RU;In Russian)
Excitation functions of the ^{209}Bi,(d,xn) and ^{209}Bi (d,pxn) reactions, 18:34327 (RA;RU;In Russian)
Excitation functions of the (p,n) reaction on zinc isotopes in the energy range E_p 4.9-5.9 MeV, 18:34265 (RA;RU;In Russian)
Excitation of ^{53}Ni and ^{54}Fe cores in (antip,p') scattering in the range of E_p=17 MeV, 18:34145 (RA;RU;In Russian)
Excitation of 2_1^+ and 2_2^+ states in ^{54,56}Fe, ^{52,60}Ni in (antip,p') scattering at E_p=16 MeV, 18:34146 (RA;RU;In Russian)
Excitation of long-living isomers in the (n,n')-reaction, 18:34409 (RA;RU;In Russian)
Excitation of low-lying states in oriented nuclei with nonzero spin by polarized protons, 18:34386 (RA;RU;In Russian)
Excitation of the 11/2$^-$ isomeric state for ^{143}Sm in the (γ,n) reaction, 18:34296 (RA;RU;In Russian)
Excited state scheme of ^{96}Rh, 18:34073 (RA;RU;In Russian)
Exhibition of (d*+p) configuration of ^{3}He in elastic p^{3}He backscattering at 0.5-1.7 GeV, 18:34361 (RA;RU;In Russian)
Exhibition of backbending for ^{176}Hf, 18:34178 (RA;RU;In Russian)
Exhibition of nodal structure of ^{6}Li nucleus cluster wave function in αd photodisintegration channel, 18:34362 (RA;RU;In Russian)
Exotic nuclear quasi molecules, 18:34149 (RA;RU;In Russian)
Experimental investigation of the ^{19}F(α,t)^{20}Ne reaction mechanism by means of α-γ correlations, 18:34321 (RA;RU;In Russian)
Experimental study on the K-shell autoionization probability in ^{203}Hg beta-decay, 18:34201 (RA;RU;In Russian)
Explicit nuclear collective potential expression in the powers of elementary invariants, 18:34107 (RA;RU)
Extrapolation of the nuclei interaction cross section in E=0 range, 18:34234 (RA;RU;In Russian)
Fast E2-transitions between states of intruder bands of $^{116'118}$Sn, 18:34161 (RA;RU;In Russian)
Fermi surface deformation at giant monopole resonance, 18:34119 (RA;RU;In Russian)
Fission isomer yield in the (n,n') and (n,γ) reactions on ^{241}Am, 18:34277 (RA;RU;In Russian)
Form factor of the ^{7}Li (α,α')^{7}Li (4.63 MeV, 7/2$^-$) inelastic scattering, 18:34309 (RA;RU;In Russian)
Formula for isomer ratios, 18:34294 (RA;RU;In Russian)
Fragmentation of the Gamow-Teller β^--transitions in the Wigner scheme, 18:34252 (RA;RU;In Russian)
Gamma of the ^{135}Ba compound state, 18:34164 (RA;RU;In Russian)
Gamma radiation induced centers in quartz glass, 18:34481 (RA;RU;In Russian)
Gamma spectra and processing system on the IBM PC/AT base, 18:33674 (RA;RU;In Russian)
Gamow-Teller strength functions of odd nuclei with pairing and inverse β-decay process cross sections, 18:34251 (RA;RU;In Russian)
Giant dipole resonance with Skyrme forces, 18:34132 (RA;RU;In Russian)
Hartree-Fock potential of nuclear matter, 18:34114 (RA;RU;In Russian)
Heavy cluster transfer in the ^{12}C,(^{4}He, ^{12}C*)^{4}He reactions, 18:34311 (RA;RU;In Russian)
High spin states of ^{86}Sr, 18:34070 (RA;RU;In Russian)
High spin states of ^{92}Mo, 18:34071 (RA;RU;In Russian)
High-energy gamma radiation source, 18:32623 (RA;RU;In Russian)
High-spin isomer in ^{143}Sm, 18:34167 (RA;RU;In Russian)
HTS oxygen index measuring on cyclotron beams, 18:34491 (RA;RU;In Russian)
Improvement of the axial-symmetrical magnetic lens characteristics, 18:33591 (RA;RU;In Russian)
Inertial characteristics of transuranium nuclei in N_pN_n scheme, 18:34142 (RA;RU;In Russian)
Influence of atoms of second, third and larger coordination spheres on conversion process in metals, 18:34433 (RA;RU;In Russian)
Influence of dynamic effects on relative changes of charge radii of strontium even isotopes, 18:34140 (RA;RU;In Russian)
Influence of final-state interaction on cross section of deuteron photodisintegration, 18:34364 (RA;RU;In Russian)
Installation for measurement of surface heterogeneity of nuclear targets, 18:33594 (RA;RU;In Russian)
Installation for radiobiological investigations with correlated particle beams, 18:33595 (RA;RU;In Russian)
Integral cross sections of the ^{3}He reaction on the ^{50,58}Fe and ^{58,64}Ni isotopes at 95 MeV, 18:34323 (RA;RU;In Russian)
Integral formalism of alpha-decay. Antisymmetrized version, 18:34215 (RA;RU;In Russian)
Intensity of ^{102}Ru gamma-radiation from the (α,2nγ) reaction, 18:34160 (RA;RU;In Russian)
Interaction of K$^+$-mesons with nucleus and nuclei at energies below 1 GeV, 18:34278 (RA;RU;In Russian)
Interference effects in the γ^{6}Li->αd reactions, 18:34302 (RA;RU;In Russian)
Interference effects in the process of photoproduction of lepton-antilepton pairs on nuclei anti magnetic moment, 18:34257 (RA;RU;In Russian)
Investigation of γ-radiation for ^{147}Tb ($T_{1/2}$=1.7h), 18:34168 (RA;RU;In Russian)
Investigation of γ-transitions of ^{170}Er in (n,n'γ) reaction, 18:34175 (RA;RU;In Russian)
Investigation of ^{120}Sn γ-transitions in the (n,n'γ) reactions, 18:34162 (RA;RU;In Russian)
Investigation of ^{142}Ce in the (n,n'γ) reaction, 18:34080 (RA;RU;In Russian)
Investigation of ^{81}Br(T_{112}=35μs) isomer photoexcitation in the 3.5-5.5 range, 18:34212 (RA;RU;In Russian)
Investigation of gamma transitions populating the 1094 keV isomeric state in the ^{167}Er(n,γ) reaction, 18:34085 (RA;RU)
Investigation of isotopic and shell effects in total cross sections of proton reactions, 18:34268 (RA;RU;In Russian)
Investigation of positron generation by radiation during channeling, 18:34483 (RA;RU;In Russian)
Investigation of resonance X-ray transition radiation of electrons in a laminated target, 18:33592 (RA;RU;In Russian)
Investigation of slowing-down processes of nuclear recoil in matter at small energies (<1 keV), 18:34244 (RA;RU;In Russian)
Investigation of slowing-down processes of ^{32}S nuclear recoil in PbS, 18:34245 (RA;RU;In Russian)
Investigation of the α-particles and ^{3}He ion scattering on the ^{24}Hg, ^{28}Si, ^{30}Si, ^{31}P, ^{32}S, 18:34315 (RA;RU;In Russian)
Investigation of the (^{3}He,α) reaction on the ^{30}Si, ^{31}P, ^{32}S nuclei at 60 MeV, 18:34316 (RA;RU;In Russian)
Investigation on the γ102 keV internal conversion in ^{183}Ta decay, 18:34184 (RA;RU;In Russian)
Investigation on the ^{181}Hf decay, 18:34183 (RA;RU;In Russian)
Investigation on the ^{183}W excited states in neutron reactions, 18:34185 (RA;RU;In Russian)
Investigation on the ^{196m1198m}Au decay, 18:34187 (RA;RU;In Russian)
Ion implantation in semiconductors at high temperatures, 18:34480 (RA;RU;In Russian)
Isomer ratio dependence on neutron energy in the ^{197}Au(n,γ)$^{198m'g}$Au, 18:34287 (RA;RU;In Russian)
Isomer ratio of the ^{118}Sn(γ,p)^{117m,g}In, 18:34295 (RA;RU;In Russian)
Isomer ratios in proton and deuteron reactions, 18:34286 (RA;RU;In Russian)
Isomer ratios of ^{98}Mo(γ,p) ^{97m,g}Nb reaction yield, 18:34306 (RA;RU;In Russian)
Isomeric ratios of the ^{96}Mo(γ,p) ^{95m,g}Nb reaction, 18:34307 (RA;RU;In Russian)
Isoscalar dipole states and the ^{18}O nucleus polarizability, 18:34106 (RA;RU;In Russian)
Isotopic dependence of cross sections of neutron scattering on Ge and Se even isotopes, 18:34272 (RA;RU;In Russian)

Isovector monopole resonances in nuclei with giant neutron halos, 18:34148 (RA;RU)

J matrix formalism in three-body problem, 18:34225 (RA;RU;In Russian)

K capture probabilities at the ^{101}Rh decay, 18:34159 (RA;RU;In Russian)

K shell autoionization in the ^{141}Ce beta decay, 18:34165 (RA;RU;In Russian)

Large area silicon spectrometric detectors and the alpha detection equipment on their base, 18:33672 (RA;RU;In Russian)

Lifetime measurement of ^{102}Ru levels by the dsa method, 18:34075 (RA;RU;In Russian)

Lifetime measurements in quasirotational bands of $^{116'118}$Sn states, 18:34078 (RA;RU;In Russian)

Linear relations between masses and Coulomb-energy differences of terms of isobaric multiplets, 18:34099 (RA;RU;In Russian)

Low-energy giant resonances in spherical nuclei, 18:34134 (RA;RU;In Russian)

Low-lying 0^+-levels in magic nuclei and 2p2h correlations in ground state, 18:34136 (RA;RU;In Russian)

M1-transitions between high-spin states in ^{79}Kr, 18:34139 (RA;RU;In Russian)

M4-excitations of ^{10}B, 18:34105 (RA;RU;In Russian)

Magnetic characteristics of collective states of $^{160'162'164}$Dy isotopes, 18:34135 (RA;RU;In Russian)

Magnetic dipole moments of the $^{147'149}$Gd ground states, 18:34081 (RA;RU;In Russian)

Magnetic hyperfine fields on ^{181}Ta nuclei in $GdFe_2$ samples crystallized under high pressure from 3.0 to 6.3 GPa, 18:34464 (RA;RU;In Russian)

Magnetic properties of rotational band in ^{159}Tb, 18:34082 (RA;RU;In Russian)

Mean-square radii and quadrupole moments of uranium isotopes, 18:34090 (RA;RU;In Russian)

Measurement of characteristics of the precise spectrometric americium-241 alpha source, 18:32625 (RA;RU;In Russian)

Measurement of charge radii of Hf nuclei by laser resonance fluorescence method, 18:34431 (RA;RU;In Russian)

Measurement of isotope shifts and hyperfine splitting for ytterbium neutron-deficient isotopes by means 0f high-sensitivity atomic spectroscopy, 18:34171 (RA;RU;In Russian)

Measurement of partial cross sections of the ^{9}Be(d,p)^{10}Be reactions, 18:34407 (RA;RU;In Russian)

Measurement of the gadolinium characteristic radiation intensity on the ^{155}Eu decay, 18:33664 (RA;RU;In Russian)

Measurement of the KX- and soft gamma radiation component intensity on the ^{153}Gd decay, 18:33665 (RA;RU;In Russian)

Measurement of the triton production cross sections in interaction of deuterons with ^{9}Be, 18:34405 (RA;RU;In Russian)

Mechanisms of nuclear reactions induced by ^{14}N ions on light nuclei, 18:34344 (RA;RU;In Russian)

Mechanisms of the $^{12}C+^{14}Ni$ reactions of E(^{14}E)=13- MeV, 18:34345 (RA;RU;In Russian)

Mechanisms of the ^{3}He, ^{6}Li and (^{H}e, ^{7}Be) reactions on the ^{16}O and ^{28}Si, 18:34303 (RA;RU;In Russian)

Method of dispersion integration on masses of complex particles in application to deuteron breakup, 18:34363 (RA;RU;In Russian)

Microscopic approach of point-mass density distribution of the ^{4}He nucleus, 18:34096 (RA;RU;In Russian)

Microscopic derivation of the collective Hamiltonian for quadrupole vibrations of even-even nuclei, 18:34098 (RA;RU;In Russian)

Microscopic description of giant resonance widths in magic nuclei, 18:34113 (RA;RU;In Russian)

Microscopic description of nonadiabatic behaviour of E2-transitions in the rare-earth nuclei, 18:34192 (RA;RU;In Russian)

Microscopic description of properties of ^{177}Hf low-lying states, 18:34086 (RA;RU;In Russian)

Microscopic description of the halo effect, 18:34094 (RA;RU;In Russian)

Microscopic description of the proton-light nuclei diffraction interaction, 18:34385 (RA;RU;In Russian)

Mixed representation for the heavy ion transfer process amplitudes, 18:34395 (RA;RU;In Russian)

Moessbauer study of the fabrication place of Dutch tile found in the lower castlee of Vilnius, 18:33302 (RA;RU;In Russian)

Momentum distribution of nucleons and clusters in atomic nuclei, 18:34127 (RA;RU;In Russian)

Momentum transfer in mean energy proton reactions with heavy nuclei, 18:34275 (RA;RU;In Russian)

Multi-phonon version of the coupled channel method and cross section analysis of low-energy neutron inelastic scattering by spherical nuclei, 18:34388 (RA;RU;In Russian)

Multipurpose installation for applied investigation on the U-240 cyclotron, 18:33593 (RA;RU;In Russian)

Nature of nuclear collective modes of negative parity, 18:34191 (RA;RU;In Russian)

Neutron activation analysis of the moss and forest litter for environment radiation monitoring, 18:33304 (RA;RU;In Russian)

Neutron-rich nuclei in a magic region near ^{132}Sn, 18:34079 (RA;RU;In Russian)

New band with $K^{\pi}=1^-$ band on 1513.900 keV level in ^{178}Hf, 18:34087 (RA;RU;In Russian)

New estimation of the characteristics values of decay and radiation $^{44}Ti+^{44}Sc$, ^{51}Cr, $^{113}Sn+^{113m}$In, 18:34217 (RA;RU;In Russian)

New magic numbers in the atomic nucleus, 18:34069 (RA;RU;In Russian)

New mechanism of the large angle scattering, 18:34312 (RA;RU;In Russian)

New method of theoretical γ-spectroscopy, 18:34181 (RA;RU;In Russian)

NMR studies of steel type EhK-73 alloying with chromium and associated processes, 18:33177 (RA;RU;In Russian)

Nuclear gamma-transitions in condensed media, 18:34199 (RA;RU;In Russian)

Nucleon decay of giant resonances, 18:34131 (RA;RU;In Russian)

Observation of rainbow scattering, 18:34313 (RA;RU)

Occupation of ^{114}Te levels in the alpha reactions, 18:34077 (RA;RU;In Russian)

Occupation of ^{27}Al levels in the (n,n'γ) reaction, 18:34068 (RA;RU;In Russian)

Occupation of ^{52}Cr levels in the (n,n'γ) reaction with reactor fast neutrons, 18:34247 (RA;RU;In Russian)

Occupation of ^{77}Se excited states in the (n,n'γ) reaction with reactor fast neutron beam, 18:34248 (RA;RU;In Russian)

Off-energy-shell behaviour of KN, πN and NN scattering amplitudes in one-meson exchange model, 18:34226 (RA;RU;In Russian)

On a possibility of a direct experimental observation of the delayed fission effect of excited heavy nuclei by means of the shadow method, 18:34349 (RA;RU;In Russian)

On angular correlations between fragments and charged particles emitted during uranium fission by protons at E_p=153 MeV, 18:34289 (RA;RU;In Russian)

On measurement of particle masses, knocked out from Au targets by high-energy heavy ions, 18:33673 (RA;RU;In Russian)

On positron states in superconductor superlattices, 18:34452 (RA;RU;In Russian)

On self-consistent approaches to IAR theory, 18:34129 (RA;RU;In Russian)

On some regularities of the decay of input states produced in the (γ,n) reaction in the 1f 712 shell regin of nuclei, 18:34211 (RA;RU;In Russian)

On the contribution nuclear unbound states of the ^{6}Li* in the inclusive deuteron spectra from (α,d) reactions on ^{3}He and ^{3}He nuclei, 18:34328 (RA;RU;In Russian)

On the D+D fusion reaction, 18:34374 (RA;RU;In Russian)

On the data authenticity of most commonly used tables on internal conversion coefficients, 18:34197 (RA;RU;In Russian)

On the mechanism of α-particle scattering by ^{16}O nuclei at E_{α}=25 MeV, 18:34318 (RA;RU;In Russian)

On the mechanism of a regular spin splitting of cross sections and the Te(n,p)m Sn(p,n) reaction cross sections, 18:34274 (RA;RU;In Russian)

On the mechanism of inelastic scattering according to the data on occupation probability of 2_1^+ level substates in the ^{24}Mg(p,p') reaction near resonance at E_p=5.903 MeV, 18:34271 (RA;RU;In Russian)

On the polarized electron scattering by oriented nuclei, 18:34367 (RA;RU;In Russian)
On the probability of ^{235}U isomeric transition in silver, 18:34196 (RA;RU;In Russian)
On the problem of isomer ratios in the (γ,γ') reaction in the 4-9 MeV range, 18:34293 (RA;RU;In Russian)
On-line system for mass analysis of the gamma-emitting isotope content in environment samples, 18:33666 (RA;RU;In Russian)
One-nucleon transfer reaction on the ^{94}Zr and ^{96}Zr isotopes, 18:34325 (RA;RU;In Russian)
Optical method for calculation of the compound process cross sections, 18:34382 (RA;RU;In Russian)
Optical model description of deuteron elastic scattering on ^{9}Be, 18:34235 (RA;RU;In Russian)
Optical potential and t matrix of neutron-nucleus scattering in Hartree-Fock approximation, 18:34383 (RA;RU;In Russian)
Orientation dependence of ^{19}F nucleus E1 and E2 multipolarity level Coulomb excitation cross section relationships in crystals, 18:34475 (RA;RU;In Russian)
Orthopositronium decay accompanied by excitation of nucleus or atomic shell, 18:34448 (RA;RU;In Russian)
Orthopositronium decay stimulated by laser radiation, 18:34449 (RA;RU;In Russian)
P-odd effects in neutron interactions with ^{117}Sn and ^{139}La nuclei and negative resonance positions, 18:34378 (RA;RU;In Russian)
Parametrization of radiative transitions in high-spin rotational band with alignment of internal angular moment, 18:34174 (RA;RU;In Russian)
Partial cross sections for the $^{45}Sc(p,\gamma)^{46}Ti$ reaction at low energy of protons, 18:34258 (RA;RU;In Russian)
Partial cross sections of the (p,n) reaction on ^{71}Ga, 18:34261 (RA;RU;In Russian)
Particle emission in quasi-fission reactions, 18:34394 (RA;RU;In Russian)
Peculiarities of refractive and diffractive contributions to cross sections of the α-particles elastic rainbow scattering by deformed nuclei, 18:34317 (RA;RU;In Russian)
PhAZA - 4π installation for study on the fragments multiplex emission in nucleus-nucleus collisions, 18:33659 (RA;RU;In Russian)
Photodisintegration of ^{236}U nucleus near threshold by linearly polarized photons, 18:34249 (RA;RU;In Russian)
Photodisintegration of ^{16}O nucleus in J matrix method, 18:34375 (RA;RU;In Russian)
Photoexcitation of the ^{190m}Os and ^{203}Pb in the 8-11 MeV range of γ-quanta, 18:34298 (RA;RU;In Russian)
Photonuclear reactions of (γ,pxn) type on $^{112}8Sn$ nucleus, 18:34308 (RA;RU;In Russian)
Photonuclear reactions: energy resolution and cross section structure, 18:34304 (RA;RU;In Russian)
Physical basis of the production and employment of ultracold (UCN) very cold (UCN) neutrons at accelerator beams and at thermonuclear reactors, 18:33455 (RA;RU;In Russian)
Pion production in the A(γ,πN)B reaction, 18:34290 (RA;RU;In Russian)
Position sensitive detector on the microchannel plates with different systems of data readout, 18:33662 (RA;RU;In Russian)
Positron annihilation process using for porous size determination, 18:34465 (RA;RU;In Russian)
Positrons sound superconductivity, 18:34451 (RA;RU;In Russian)
Possibilities of application of the backscattering method for control of the integral circuit technological layers, 18:32626 (RA;RU;In Russian)
Possible manifestation of electrodynamics parameters in nuclear states energies and particle masses, 18:34054 (RA;RU;In Russian)
Potential description of light nucleus electrodisintegration, 18:34377 (RA;RU;In Russian)
Precise method for operative measurement of material absorption properties for γ- and β-radiations, 18:34402 (RA;RU;In Russian)
Probabilities of beta-transitions in dynamical collective model, 18:34208 (RA;RU;In Russian)
Production and investigation on the beam of circularly polarized shower γ-quanta in crystal media, 18:34418 (RA;RU;In Russian)
Production of quasimonochromatic gamma radiation for nuclear spectroscopy purpose, 18:33993 (RA;RU;In Russian)
Properties of ^{48}Ti excited states from the (n,n'γ) reaction, 18:34246 (RA;RU;In Russian)
Proton polarization in the $^{12}C(K^+, K_p^+)^{11}B$ reaction at 0.6 and 0.85 GeV/c initial kaons, 18:34359 (RA;RU;In Russian)
Proton polarization in the d(K^+, K^+p)n reaction at 0.6 GeV/c kaon momentum, 18:34360 (RA;RU;In Russian)
Proton reactions rates on nuclei ^{6}Li, ^{7}Li and ^{9}Be, 18:34408 (RA;RU;In Russian)
Proton-neutron interactions and masses of nuclei with Z>N, 18:34112 (RA;RU;In Russian)
Quasi-free capture by clusters and rescattering process in pion-nucleus absorption reactions, 18:34284 (RA;RU;In Russian)
Quasivibrational and nonvibrational 4^+ states of ^{56}Fe in the (antip,p') scattering at e_p=16 MeV, 18:34264 (RA;RU;In Russian)
Radiation-induced current-transport in metal-dielectric-semiconductor structures, 18:34477 (RA;RU;In Russian)
Radiative proton capture by ^{69}Ga nuclei, 18:34260 (RA;RU;In Russian)
Radiative strength functions for E1-transitions of some nuclei, 18:34155 (RA;RU;In Russian)
Radioactive sodium isotope separation by means of light-induced drift, 18:32617 (RA;RU;In Russian)
Rainbow scattering of radioactive nuclei, 18:34352 (RA;RU)
Ratios of decay probabilities of $^{8}Be^*$ high-excited states in the $^{10}B(d,\alpha)2\alpha$ and $^{10}B(d,\alpha)p$, ^{7}Li reactions, 18:34329 (RA;RU;In Russian)
Reaction mechanisms of inelastic pion-nucleus scattering at intermediate energies, 18:34282 (RA;RU;In Russian)
Recursion mass formula for heavy even-even isotopes, 18:34100 (RA;RU;In Russian)
References for beta-spectrometer calibration in low-energy range, 18:33663 (RA;RU;In Russian)
Refraction effects in the ^{3}He, ^{3}He,$^{3}He'$ and ($^{3}He,\alpha$) reactions on ^{30}Si nuclei at E(^{3}He)=60 MeV, 18:34332 (RA;RU;In Russian)
Resonance scattering of alpha-particles on oxygen and its use in nuclear microanalysis, 18:33301 (RA;RU;In Russian)
Resonances in the $^{36}S(p\gamma)^{37}Cl$, 18:34144 (RA;RU;In Russian)
Role of final-state NN interaction in the $^{6}He(2^+)$,^{6}Li (2^+,T=1) and $^{6}Be(2^+)$ three-particle decays, 18:34213 (RA;RU;In Russian)
Role of multiple exchange of nucleon in the $^{16}O(d,p)^{17}O^*$ stripping in the polarization characteristics calculation, 18:34403 (RA;RU;In Russian)
Role of nuclear relativism in calculations of magnetic form factors, 18:34093 (RA;RU;In Russian)
Role of quantum fluctuations in decay of double nuclear system, 18:34390 (RA;RU;In Russian)
Rotational interpretation of ^{192}Ir, 18:34088 (RA;RU)
Rotational interpretation of ^{194}Ir, 18:34089 (RA;RU)
Rotational-vibrational excited states of deformed even-even nuclei, 18:34111 (RA;RU;In Russian)
Scattering of vector charged particles in nucleus Coulomb field, 18:34227 (RA;RU;In Russian)
Scheme of decay of the 7937 keV ^{158}Gd compound state excited in (n,γ) reaction, 18:34173 (RA;RU;In Russian)
Scintillation detectors of charged particles with application of natural diamond crystal, 18:33668 (RA;RU;In Russian)
Search for excited states of ^{6}He rotating to the soft mode of dipole resonance, 18:34342 (RA;RU;In Russian)
Search for the isotopic effect in the 40 MeV deuteron disintegration in interactions with ^{58}Ni and ^{64}Ni nuclei, 18:34333 (RA;RU;In Russian)
Selected intervals in distribution of high-excited nuclear level distances (2), 18:34076 (RA;RU;In Russian)
Selection rules in isospin and the widths of high-excited states for light nuclei, 18:34092 (RA;RU;In Russian)
Self-consistent description of pair correlation effects with semiphenomenological nucleon-nucleon forces, 18:34141 (RA;RU;In Russian)
Self-consistent potential of atomic nuclei and fragmentation effects, 18:34115 (RA;RU;In Russian)
Semiclassical calculation of collective motion parameters of 'cold' nuclei, 18:34130 (RA;RU;In Russian)

Sensitivity analysis of reaction cross section and zero-angle scattering amplitude to structure of nuclear optical potential for 1.37 GeV alpha particles, 18:34368 (RA;RU;In Russian)
Shaking-off nucleons with weakly coupled projectile and their rescattering in the nucleus-target field, 18:34391 (RA;RU;In Russian)
Shell effects and production cross sections of the Fr, Ra, and Ac neutron-deficient isotopes with N=126 in the $^{197}Au+^{20,22}Ne$ reactions, 18:34354 (RA;RU;In Russian)
Shell structure influence on distribution of excitation energy between nuclei, 18:34397 (RA;RU;In Russian)
Shell structure of ^{12}C nucleus and slow π^--meson absorption, 18:34358 (RA;RU;In Russian)
Simple microscopic model of beta-decay strength function, 18:34188 (RA;RU;In Russian)
Soft dipole resonance in ^{11}Li in three-particle cluster model with continuous spectrum, 18:34097 (RA;RU;In Russian)
Solution of the inverse scattering problem in flameworks of the P-matrix approach, 18:33988 (RA;RU;In Russian)
Spectra of $\gamma\gamma$-coincidences of ^{187}W in (n,γ) reaction, 18:34186 (RA;RU;In Russian)
Spectra of γ-γ coincidences for ^{124}Te in the (n,γ) reaction, 18:34163 (RA;RU;In Russian)
Spectra of the ^{9}Be and ^{9}B nuclei in the three-particle multicluster model, 18:34101 (RA;RU;In Russian)
Spectroscopic factors and classification of cluster decays of even-even nuclei, 18:34194 (RA;RU;In Russian)
Spin-isospin response of nucleus in process of the single charge-exchange pion, 18:34380 (RA;RU;In Russian)
Spin-neutrino angular correlations at muon capture in ^{28}Si, 18:34254 (RA;RU;In Russian)
Spontaneous and induced two-body fragmentation, 18:34216 (RA;RU;In Russian)
Stabilizing shell effect and unified character of its parameters, 18:34067 (RA;RU;In Russian)
Standard isotopic x-radiation sources (SIXRS), 18:32624 (RA;RU;In Russian)
Stochastic approach to description of nuclear collective motion, 18:34117 (RA;RU;In Russian)
Stochastic model of heated fissile nucleus relation, 18:34399 (RA;RU;In Russian)
Strength functions of β^+ (electron capture) decays and delayed fission of neutron-deficient pre-actinide nuclei, 18:34177 (RA;RU;In Russian)
Structure of resonance state wave functions in continuum range for 1d-2s shell nuclei, 18:34150 (RA;RU;In Russian)
Structure of the (γ,n) cross sections on ^{90}Zr, 18:34300 (RA;RU;In Russian)
Structure of the (γ,n) cross section on ^{116}Sn, 18:34301 (RA;RU;In Russian)
Structure of the (γ,n) reaction cross section on ^{142}Nd, 18:34299 (RA;RU;In Russian)
Study of anomalous proton optical potential near Fermi energy, 18:34267 (RA;RU;In Russian)
Study of energy dependence of B type pair coherent production in Ge crystal, 18:34482 (RA;RU;In Russian)
Study of long-lived charge exchange of carbon foils, 18:33270 (RA;RU;In Russian)
Study of NGR factors determining Fe-W alloy formation at laser synthesis, 18:33178 (RA;RU;In Russian)
Study of P-even angular asymmetry of ^{235}U fission fragments spread relatively to the direction of a slow neutron beam in the energy range 1 to 136 eV, 18:34276 (RA;RU;In Russian)
Study of relative neutron and proton yields in the (p,pn) and (p,2p) reactions, 18:34270 (RA;RU;In Russian)
Study of the $^{12}(\gamma,\pi^-p)$ reaction in a wide range of kinematic variable variations, 18:34291 (RA;RU;In Russian)
Study of the (K^+,K_n) reaction at 60 MeV, 18:34279 (RA;RU;In Russian)
Study of the dispersion corrections role in the inelastic proton scattering on ^{28}Si at E-p<30 MeV, 18:34281 (RA;RU;In Russian)
Study on a density of the excited strongly-deformed states of the actinide nuclei, 18:34147 (RA;RU;In Russian)
Study on nuclear multifragmentation by means of 4π-phase facility, 18:34339 (RA;RU;In Russian)
Study on the ^{11}Li nuclear structure in the $^{11}B+^{14}C$ reaction, 18:34343 (RA;RU;In Russian)
Study on the $^{16}O(d,p)^{17}O^*$ stripping in the frame of different approaches, 18:34233 (RA;RU;In Russian)
Study on the ^{177}Lu in $(n,2\gamma)$ reaction, 18:34179 (RA;RU;In Russian)
Study on the $(\alpha, ^3He)$ reaction on the ^{16}O, $^{28,30}Si$, ^{32}S nuclei the ^{30}Si at 50.5 MeV, 18:34221 (RA;RU;In Russian)
Study on the $A(^{11}Li, ^{9}Li)$ reaction mechanisms and ^{11}Li nucleus structure, 18:34393 (RA;RU;In Russian)
Study on the beta and gamma isotope concentration in environment beyond the 30 km Chernobyl NPP accident zone, 18:33811 (RA;RU;In Russian)
Study on the electronic shell reconstruction influence on the low-energy conversion transition in ^{90m}Tc, 18:34206 (RA;RU;In Russian)
Study on the nuclear fission in the region of the Busonaro-Gallone point, 18:34347 (RA;RU;In Russian)
Study on the reaction product spectra at high excitation energies of nuclei, 18:34400 (RA;RU;In Russian)
Study on the two-nucleon transfer reactions by means of the ^{6}He secondary beams, 18:34341 (RA;RU;In Russian)
SU_3 band mixing effects in the framework of strictly restricted dynamics model, 18:34109 (RA;RU)
Subbarrier fusion of identical heavy nuclei, 18:34396 (RA;RU;In Russian)
Superconducting detectors of nuclear particles, 18:33675 (RA;RU;In Russian)
Surface and inner excitation of 2^+ states in ^{28}Si in inelastic proton scattering, 18:34263 (RA;RU;In Russian)
T-matrix approximation for description of (d, dp) and $(\alpha, \alpha p)$ reactions on light nuclei at mean energies, 18:34365 (RA;RU;In Russian)
Tables of internal conversion coefficients in Dirac-Fock field for observed high-multipolarity nuclear transitions, 18:34432 (RA;RU;In Russian)
Taking corrections for inelastic scattering of deuterons and α-particles on light nuclei at mean energies, 18:34376 (RA;RU;In Russian)
Tantalum nitriding study by average energy proton nucleus backscattering, 18:33226 (RA;RU;In Russian)
Technique of study on quasicontinuous gamma spectra in inelastic nucleon-atomic nuclei interaction, 18:33669 (RA;RU;In Russian)
Technique of the characteristic radiation apparatus spectra processing in X-ray spectral analysis by means of a Si(Li) detector, 18:33671 (RA;RU;In Russian)
Temperature-dependent 'surface tension' in the ideal Fermi gas model, 18:34124 (RA;RU;In Russian)
The quadrupole and octupole excitations of $^{162,164}Dy$, 18:34084 (RA;RU)
The role of final-state interaction of n+d subsystem in deuterium breakup reaction on deuterons at 13.6 MeV, 18:34269 (RA;RU;In Russian)
Theoretical interpretation of semiempirical formula for total cross sections of nucleus-nucleus reactions, 18:34398 (RA;RU;In Russian)
Theoretical investigation of gamma radiation of excited nuclei in the $\gamma A \rightarrow \pi A^*$ reactions, 18:34387 (RA;RU;In Russian)
Threshold effects in compound reactions followed by fission, 18:34406 (RA;RU;In Russian)
Total absorption spectrometer for measurement of the beta-decay force function, 18:33661 (RA;RU;In Russian)
Total cross sections from the (p,n) reaction on molybdenum isotopes at E_p=5-6 MeV, 18:34266 (RA;RU;In Russian)
Total cross sections of the ^{3}He reactions with nuclei, 18:34319 (RA;RU;In Russian)
Transitions between the $7/2^+$ (633) and $7/2^-$ (514) bands in ^{177}Hf, 18:34180 (RA;RU;In Russian)
Tritium beta-decay with beta-electron transition into bound state, 18:34200 (RA;RU;In Russian)
Two-center model of rotational states in atomic nuclei, 18:34143 (RA;RU;In Russian)
Two-neutrino double beta decay of ^{110}Mo in ^{100}Ru excited states, 18:34195 (RA;RU;In Russian)

Two-particle photodisintegration of three-nucleon nuclei and polarization phenomena at low energies, 18:34370 (RA;RU;In Russian)
Two-photon 0^+-0^+ transition in ^{90}Zr, 18:34204 (RA;RU;In Russian)
Two-quasiparticle spectra in the range of $_{50}{}^{132}Sn_{82}$, 18:34125 (RA;RU;In Russian)
Unified approach to description of the nuclear dynamics and properties of the ground state, 18:34091 (RA;RU;In Russian)
Unified mechanism of changes of radiation-induced surface state spectrum and oxide charge in Si-SiO_2 system, 18:34478 (RA;RU;In Russian)
Use of helium ions backscattering method for determination of gold content in ores, 18:33299 (RA;RU;In Russian)
Using the real nuclear Hamiltonian for analysis of nucleon scattering by nonaxial deformed even-even nuclei, 18:34384 (RA;RU;In Russian)
Variable moment of inertia model for description of odd nuclei rotation, 18:34128 (RA;RU;In Russian)
Vectorial interaction in the strictly restricted dynamics model, 18:34108 (RA;RU)
Vertex constants and spectroscopic factors from the ^{3}He,d reaction analysis on the ^{9}Be and ^{11}B nuclei, 18:34330 (RA;RU;In Russian)
Vibrational 0^+-4^+ excitations in spherical nuclei, 18:34133 (RA;RU;In Russian)
Vibrational states effect on thermodynamic characteristics of heated nuclei, 18:34120 (RA;RU;In Russian)
Wave function structure of the ^{6}He and ^{11}Li nuclei, 18:34095 (RA;RU;In Russian)
Wide-aperture coordinate scintillation spectrometer, 18:33670 (RA;RU;In Russian)
Woolf-Bragg scattering of alpha-particles on nuclei, 18:34228 (RA;RU;In Russian)
Y-distributions of electrons from νe and antiνe scatterings as test for study of standard electroweak model, 18:34045 (RA;RU;In Russian)
Yields of rare earth elements in the ^{238}U photofission, 18:34250 (RA;RU;In Russian)
Yrast band of ^{93}Nb, 18:34158 (RA;RU;In Russian)

AN SSSR, Moscow (Russian Federation)

^{11}Li(29 MeV/nucleon) elastic scattering on silicon nuclei, 18:34350 (RA;RU;In Russian)
^{162}Dy studied with the (d,p), (d,t), (n,γ) and (n,n'γ) reactions, 18:34083 (RA;RU)
^{178m2}Hf exotic nucleus-target and heavy ion reactions, 18:34353 (RA;RU;In Russian)
^{241}Am decay, 18:34218 (RA;RU;In Russian)
^{25}Mg(d,^{6,7}Li) reaction at E_d=13.6 MeV, 18:34331 (RA;RU;In Russian)
(α,xn) reactions on ^{124}Sn isotope, 18:34326 (RA;RU;In Russian)
(π^-,-x) and (π^-,2px) reactions on C,N,O and Ag, Br at energy of 170 MeV, 18:34283 (RA;RU;In Russian)
102-element isotope production in the ^{32}Ne+^{236}U and ^{26}Mg+^{232}Th reactions, 18:34346 (RA;RU;In Russian)
444.6 keV-isomeric transition in ^{152}Gd, 18:34170 (RA;RU;In Russian)
Activation analysis of isotope-enriched substance of ytterbium-176, 18:33298 (RA;RU;In Russian)
Activation determination of C, N and O in mercury diiodide crystals, 18:33297 (RA;RU;In Russian)
Activation of aluminium foils by ^{4}He ions with 25-45 MeV energies, 18:34336 (RA;RU;In Russian)
Alagi rules violation in transitions between the $9/2^+(624)$ and $7/2^-(514)$ band levels in ^{177}Hf, 18:34182 (RA;RU;In Russian)
Alpha decay of ^{156}Er, 18:34172 (RA;RU;In Russian)
Alpha-, beta- and proton stability of mean and heavy nuclei, 18:34207 (RA;RU;In Russian)
Alpha-particle scattering by ^{50}Ti at 40 and 50 MeV energies, 18:34337 (RA;RU;In Russian)
Analysis and estimation of photonuclear reactions on copper isotopes, 18:34292 (RA;RU;In Russian)
Analysis of depth profile of oxygen distribution in HTSC-films using nuclear reaction ^{16}O(d,α)^{14}N, 18:33227 (RA;RU;In Russian)
Analysis of excitation functions of reactions induced by alpha particles on ^{116,117,118,120,124}Sn at 13-24.4 MeV energies, 18:34334 (RA;RU;In Russian)
Analysis of the angular correlation function in the massive transfer reactions in the frame of direct and statistical approaches, 18:34392 (RA;RU;In Russian)
Analysis of time characteristics of the excited actinide nucleus decay using of phenomenological model of level density, 18:34214 (RA;RU;In Russian)
Angular dependence of the ^{6}Li(2.18 MeV, 3^+) nucleus polarization in the 80 MeV α-particles inelastic scattering, 18:34253 (RA;RU;In Russian)
Angular distribution of γ-quanta produced in M1-resonance decay calculated from the first excited state of ^{34}Cl, 18:34209 (RA;RU;In Russian)
Angular distribution of internal bremsstrahlung quanta from beta decay of polarized nuclei, 18:34202 (RA;RU;In Russian)
Angular momentum of compound nuclei in the heavy ion near-barrier fusion reactions, 18:34401 (RA;RU;In Russian)
Application of the nuclear backscattering method for measurement of the proton stopping cross sections in the 80-240 keV energy range, 18:34420 (RA;RU;In Russian)
Attenuation of nuclear zerosound as a delayed effect in kinetic equation, 18:34118 (RA;RU;In Russian)
Autoionization of K shell in β-decay of ^{170}Tm, 18:34176 (RA;RU;In Russian)
Backward scattering in the region of the deep rainbow shadow, 18:34314 (RA;RU)
Bremsstrahlung of polarized electrons in case of fixed energy transferred to nucleus, 18:34256 (RA;RU;In Russian)
Calculation of isomer ratios in the ^{130}Te(αn)^{133}Xe, ^{136}Ce(αn)^{139}Nd, ^{175}Lu(αn)^{178}Ta and ^{194}Pt(αn)^{197}Hg reactions, 18:34340 (RA;RU;In Russian)
Calculation of relative probabilities of atomic electron capture by nucleus, 18:34203 (RA;RU;In Russian)
Calculation of scattering NN-phase by phase function method, 18:34224 (RA;RU;In Russian)
Calculation of the semiconductor detector-dosimeter characteristics, 18:33676 (RA;RU;In Russian)
Capability of nuclear microanalysis for determination of microelements content in patients with dermatities from regions with favorable and unfavorable radiation situation, 18:33300 (RA;RU;In Russian)
Cascades of γ-transitions of the ^{143}Nd compound state decay, 18:34166 (RA;RU;In Russian)
Caustic features of wave function of the light ion elastic scattering, 18:34231 (RA;RU;In Russian)
Change of quasiparticle vacuum properties in aligned multiphonon bands, 18:34123 (RA;RU;In Russian)
Charged particle emission during slow negative pion absorption by uranium nuclei, 18:34288 (RA;RU;In Russian)
Charged particle scattering on isotones, 18:34189 (RA;RU;In Russian)
Cluster radioactivity of nuclei with $A<208$, 18:34193 (RA;RU;In Russian)
Coherent photoproduction of postulated neutral particle in crystals, 18:34047 (RA;RU;In Russian)
Collective excitation mechanism in α-particle inelastic scattering by ^{12}C nuclei at E_α=25 MeV, 18:34320 (RA;RU;In Russian)
Common potential of hadron-nuclear interaction at particle energies $\leq$1 GeV in kinematically corrected impulse approximation, 18:34369 (RA;RU;In Russian)
Comparative description pA and p-barA scattering under diffraction scaling conditions, 18:34372 (RA;RU;In Russian)
Comparison of two examples of a generalized optical model in the analysis of neutron cross sections for Te, 18:34273 (RA;RU;In Russian)
Competition of the nucleon quasi-free knockout by mean-energy antinucleons and antinucleon annihilation in nuclei, 18:34366 (RA;RU;In Russian)
Connection of macroscopic and microscopic approaches to the description of the double nuclear system dynamics, 18:34389 (RA;RU;In Russian)

Consistent calculation of polarized electric dipole moment by shell correction method, 18:34121 (RA;RU;In Russian)
Construction of the effective NN-potential on data for the light, intermediate and heavy nuclei, 18:34102 (RA;RU;In Russian)
Conversion electron spectrum of 1.56 keV transition in ^{201}Hg, 18:34198 (RA;RU;In Russian)
Correlation method for study on nonbound states of nuclei in multiparticle heavy ion reactions, 18:34351 (RA;RU;In Russian)
Coulomb excitation of E1 and E2 transitions in ^{19}F nucleus of LiF crystal by protons and antiprotons, 18:34476 (RA;RU;In Russian)
Cross section of the ^{113}In (γ,2n) ^{111m,g}In reactions, 18:34305 (RA;RU;In Russian)
Cross sections for the (p,γ0,1,2) reaction on ^{65}Cu near the threshold of neutron emission, 18:34259 (RA;RU;In Russian)
Cross sections of (p,X)-reactions in molibdenum target at E_p=660 MeV, 18:34219 (RA;RU;In Russian)
Cross sections of radioisotopes production in the silver target irradiated by protons with 660 MeV energy, 18:34404 (RA;RU;In Russian)
CsI(Tl) film scintillation of large area, 18:33658 (RA;RU;In Russian)
Data analysis on ^{3}He elastic and inelastic scattering at low and mean energies on nuclei with 40<A<124, 18:34338 (RA;RU;In Russian)
Decay of ^{143}Tb (60 min), 18:34169 (RA;RU;In Russian)
Decay scheme of ^{93}Mo, 18:34072 (RA;RU;In Russian)
Dependence of muon EO conversion probability on nuclear models, 18:34450 (RA;RU;In Russian)
Dependence of nucleon-nucleus interaction cross section on momentum distribution of nucleons in the nucleus-target, 18:34379 (RA;RU;In Russian)
Description of hadron-hadron interaction on the base of P-matrix approach, 18:34046 (RA;RU;In Russian)
Description of properties of finite final nuclei and nucleon-nucleus potentials on the base of NN potentials of the mesonic theory, 18:34103 (RA;RU;In Russian)
Description of properties of the neutron-rich nuclei in the hyperspherical function method, 18:34104 (RA;RU;In Russian)
Detecting modulus on the silicon position sensitive detectors for the VASILISA separator, 18:33660 (RA;RU;In Russian)
Detection method in environment of hot particles as products of accident on the Chernobyl nuclear power plant, 18:33667 (RA;RU;In Russian)
Detection of light charged particles by scintillation phosphich detector, 18:33657 (RA;RU;In Russian)
Determination of concentration profile of titanium using reaction ^{48}Ti(p,γ)^{49}V, 18:33303 (RA;RU;In Russian)
Determination of correcting slowing-down factors of Ru in Mo for the alpha reactions, 18:34074 (RA;RU;In Russian)
Determination of electric field gradient in palladium hydrides by ^{60}Co impurity nuclei orientation method, 18:34466 (RA;RU;In Russian)
Determination of k capture probabilities for decay of ^{75}Se, 18:34157 (RA;RU;In Russian)
Deuteron stripping reaction at intermediate energies, 18:34223 (RA;RU;In Russian)
Differential cross sections of neutron scattering with energy of 70-400 keV and middle parameters of neutron resonances for ^{110,113,116}Cd, 18:34285 (RA;RU;In Russian)
Diffractive structure of pion spectrum in ion-ion collisions, 18:34355 (RA;RU;In Russian)
Dipole giant resonance over the first excited state of ^{12}C, 18:34297 (RA;RU;In Russian)
Direct nucleon decay of giant resonances, 18:34122 (RA;RU;In Russian)
Distribution of octupole force in deformed nuclei up to 6 MeV energy, 18:34116 (RA;RU;In Russian)
Distribution oven states of M2-transition forces in odd nuclei of p shell, 18:34190 (RA;RU;In Russian)
Double nuclear system as the initial state for compound nucleus production - new mechanism of heavy nuclear system fusion: Model, 18:34229 (RA;RU;In Russian)
Double nuclear system as the initial state for compound nucleus production - new mechanism of heavy nuclear system fusion: Comparison with the experiment, 18:34230 (RA;RU;In Russian)
Duration of compound reactions in frameworks of random matrix model, 18:34222 (RA;RU;In Russian)
E1-radiative decay of analog resonance in ^{35}Cl, 18:34210 (RA;RU;In Russian)
E1-radiative strength functions in 'heated' deformed nuclei, 18:34137 (RA;RU;In Russian)
Effect of angular momentum on mass and energy distributions of fission fragments, 18:34348 (RA;RU;In Russian)
Effect of four quasi-particle configurations and correlations in ground state on the lowest 2^+-state energy, 18:34138 (RA;RU;In Russian)
Effective account of hexadecupole modes in the nuclear collective model with dynamical quadrupole deformations, 18:34110 (RA;RU;In Russian)
Effective Hamiltonian of interaction of quasiparticles with core quadrupole excitations, 18:34126 (RA;RU;In Russian)
Effective potentials and the equation of the hypernuclear matter state, 18:34151 (RA;RU;In Russian)
Effects of non-zero mass, electromagnetic interactions and helicity of neutrino in elastic neutrino (antineutrino) -electron scattering, 18:34044 (RA;RU;In Russian)
Effects of radiation-stimulated improvement of the metal-semiconductor interface quality, 18:33691 (RA;RU;In Russian)
Elastic scattering ^{12}C ^{4}He,^{4}He^{12}CV at E_α=72 and 81 MeV, 18:34310 (RA;RU;In Russian)
Elastic scattering and breakup of weakly coupled particles in adiabatic approximation, 18:34373 (RA;RU;In Russian)
Elastic scattering of antiprotons on ^{4}He nucleus, 18:34357 (RA;RU;In Russian)
Elastic scattering of antiprotons by ^{12}C and ^{16}O nuclei and α-cluster model with dispersion, 18:34371 (RA;RU;In Russian)
Elastic scattering of p^{11}Li at intermediate energies, 18:34280 (RA;RU;In Russian)
Electron capture-to-positron emission for decay of ^{58}Co and ^{74}As, 18:34156 (RA;RU;In Russian)
Electrostatic charge-exchange accelerator for investigations on the nuclear spectroscopy and structure, 18:33477 (RA;RU;In Russian)
Emission of α-particles and nucleons in deuteron interaction with Zr nuclei, 18:34324 (RA;RU;In Russian)
Emission of fast positrons and electrons in ion-ion collisions at intermediate energies, 18:34356 (RA;RU;In Russian)
Energy dependence of isomer ratios in the ^{116}Sn(d,n)^{119m,g}Te, ^{117}Sn(α,2n)^{119m,g}Te,^{118}Sn(d,n)^{121m,g}Te reactions, 18:34335 (RA;RU;In Russian)
Energy dependence of proton slowing-down cross section in high-Tc superconductor, 18:34479 (RA;RU;In Russian)
Energy dependence pf (antip,p')-scattering on Si with excitation of 2^+ and 3^- (T=0) states, 18:34262 (RA;RU;In Russian)
Estimation of (A,Z)(ν_e,e^-)(A,Z+1) reaction cross section, 18:34255 (RA;RU;In Russian)
Estimation of probability for the two-photon decay of the ^{137}Ba 662 keV isomeric state, 18:34205 (RA;RU;In Russian)
Estimation of the (n,n') reaction cross sections on ^{208}Pb nucleus, 18:34381 (RA;RU;In Russian)
Exchange correlation function and surface effects, 18:34232 (RA;RU;In Russian)
Excitation cross-section of L-shell characteristic X-rays of neptunium by protons, 18:34419 (RA;RU;In Russian)
Excitation functions for the ^{22,24}Na and ^{7}Be isotopes in ^{3}He ion interaction with Si nuclei at energies up to 95 MeV, 18:34322 (RA;RU;In Russian)
Excitation functions of the ^{209}Bi,(d,xn) and ^{209}Bi (d,pxn) reactions, 18:34327 (RA;RU;In Russian)
Excitation functions of the (p,n) reaction on zinc isotopes in the energy range E_p 4.9-5.9 MeV, 18:34265 (RA;RU;In Russian)
Excitation of ^{53}Ni and ^{54}Fe cores in (antip,p') scattering in the range of E_p=17 MeV, 18:34145 (RA;RU;In Russian)
Excitation of 2_1^+ and 2_2^+ states in ^{54,56}Fe, ^{52,60}Ni in (antip,p') scattering at E_p=16 MeV, 18:34146 (RA;RU;In Russian)
Excitation of long-living isomers in the (n,n')-reaction, 18:34409 (RA;RU;In Russian)
Excitation of low-lying states in oriented nuclei with nonzero spin by polarized protons, 18:34386 (RA;RU;In Russian)

Excitation of the $11/2^-$ isomeric state for ^{143}Sm in the (γ,n) reaction, 18:34296 (RA;RU;In Russian)
Excited state scheme of ^{96}Rh, 18:34073 (RA;RU;In Russian)
Exhibition of (d*+p) configuration of ^{3}He in elastic p^{3}He backscattering at 0.5-1.7 GeV, 18:34361 (RA;RU;In Russian)
Exhibition of backbending for ^{176}Hf, 18:34178 (RA;RU;In Russian)
Exhibition of nodal structure of ^{6}Li nucleus cluster wave function in αd photodisintegration channel, 18:34362 (RA;RU;In Russian)
Exotic nuclear quasi molecules, 18:34149 (RA;RU;In Russian)
Experimental investigation of the ^{19}F(α,t)^{20}Ne reaction mechanism by means of α-γ correlations, 18:34321 (RA;RU;In Russian)
Experimental study on the K-shell autoionization probability in ^{203}Hg beta-decay, 18:34201 (RA;RU;In Russian)
Explicit nuclear collective potential expression in the powers of elementary invariants, 18:34107 (RA;RU)
Extrapolation of the nuclei interaction cross section in E=0 range, 18:34234 (RA;RU;In Russian)
Fast E2-transitions between states of intruder bands of $^{116'118}$Sn, 18:34161 (RA;RU;In Russian)
Fermi surface deformation at giant monopole resonance, 18:34119 (RA;RU;In Russian)
Fission isomer yield in the (n,n') and (n,γ) reactions on ^{241}Am, 18:34277 (RA;RU;In Russian)
Form factor of the ^{7}Li (α,α')^{7}Li (4.63 MeV, $7/2^-$) inelastic scattering, 18:34309 (RA;RU;In Russian)
Formula for isomer ratios, 18:34294 (RA;RU;In Russian)
Fragmentation of the Gamow-Teller β^--transitions in the Wigner scheme, 18:34252 (RA;RU;In Russian)
Gamma of the ^{135}Ba compound state, 18:34164 (RA;RU;In Russian)
Gamma radiation induced centers in quartz glass, 18:34481 (RA;RU;In Russian)
Gamma spectra and processing system on the IBM PC/AT base, 18:33674 (RA;RU;In Russian)
Gamow-Teller strength functions of odd nuclei with pairing and inverse β-decay process cross sections, 18:34251 (RA;RU;In Russian)
Giant dipole resonance with Skyrme forces, 18:34132 (RA;RU;In Russian)
Hartree-Fock potential of nuclear matter, 18:34114 (RA;RU;In Russian)
Heavy cluster transfer in the ^{12}C,(^{4}He, ^{12}C*)^{4}He reactions, 18:34311 (RA;RU;In Russian)
High spin states of ^{86}Sr, 18:34070 (RA;RU;In Russian)
High spin states of ^{92}Mo, 18:34071 (RA;RU;In Russian)
High-energy gamma radiation source, 18:32623 (RA;RU;In Russian)
High-spin isomer in ^{143}Sm, 18:34167 (RA;RU;In Russian)
HTS oxygen index measuring on cyclotron beams, 18:34491 (RA;RU;In Russian)
Improvement of the axial-symmetrical magnetic lens characteristics, 18:33591 (RA;RU;In Russian)
Inertial characteristics of transuranium nuclei in N_pN_n scheme, 18:34142 (RA;RU;In Russian)
Influence of atoms of second, third and larger coordination spheres on conversion process in metals, 18:34433 (RA;RU;In Russian)
Influence of dynamic effects on relative changes of charge radii of strontium even isotopes, 18:34140 (RA;RU;In Russian)
Influence of final-state interaction on cross section of deuteron photodisintegration, 18:34364 (RA;RU;In Russian)
Installation for measurement of surface heterogeneity of nuclear targets, 18:33594 (RA;RU;In Russian)
Installation for radiobiological investigations with correlated particle beams, 18:33595 (RA;RU;In Russian)
Integral cross sections of the ^{3}He reaction on the ^{50,58}Fe and ^{58,64}Ni isotopes at 95 MeV, 18:34323 (RA;RU;In Russian)
Integral formalism of alpha-decay. Antisymmetrized version, 18:34215 (RA;RU;In Russian)
Intensity of ^{102}Ru gamma-radiation from the (α,2nγ) reaction, 18:34160 (RA;RU;In Russian)
Interaction of K$^+$-mesons with nucleus and nuclei at energies below 1 GeV, 18:34278 (RA;RU;In Russian)
Interference effects in the γ^{6}Li->αd reactions, 18:34302 (RA;RU;In Russian)
Interference effects in the process of photoproduction of lepton-antilepton pairs on nuclei anti magnetic moment, 18:34257 (RA;RU;In Russian)
Investigation of γ-radiation for ^{147}Tb ($T_{1/2}$=1.7h), 18:34168 (RA;RU;In Russian)
Investigation of γ-transitions of ^{170}Er in (n,n'γ) reaction, 18:34175 (RA;RU;In Russian)
Investigation of ^{120}Sn γ-transitions in the (n,n'γ) reactions, 18:34162 (RA;RU;In Russian)
Investigation of ^{142}Ce in the (n,n'γ) reaction, 18:34080 (RA;RU;In Russian)
Investigation of ^{81}Br(T_{112}=35μs) isomer photoexcitation in the 3.5-5.5 range, 18:34212 (RA;RU;In Russian)
Investigation of gamma transitions populating the 1094 keV isomeric state in the ^{167}Er(n,γ) reaction, 18:34085 (RA;RU)
Investigation of isotopic and shell effects in total cross sections of proton reactions, 18:34268 (RA;RU;In Russian)
Investigation of positron generation by radiation during channeling, 18:34483 (RA;RU;In Russian)
Investigation of resonance X-ray transition radiation of electrons in a laminated target, 18:33592 (RA;RU;In Russian)
Investigation of slowing-down processes of nuclear recoil in matter at small energies (<1 keV), 18:34244 (RA;RU;In Russian)
Investigation of slowing-down processes of ^{32}S nuclear recoil in PbS, 18:34245 (RA;RU;In Russian)
Investigation of the α-particles and ^{3}He ion scattering on the ^{24}Hg, ^{28}Si, ^{30}Si, ^{31}P, ^{32}S, 18:34315 (RA;RU;In Russian)
Investigation of the (^{3}He,α) reaction on the ^{30}Si, ^{31}P, ^{32}S nuclei at 60 MeV, 18:34316 (RA;RU;In Russian)
Investigation on the γ102 keV internal conversion in ^{183}Ta decay, 18:34184 (RA;RU;In Russian)
Investigation on the ^{181}Hf decay, 18:34183 (RA;RU;In Russian)
Investigation on the ^{183}W excited states in neutron reactions, 18:34185 (RA;RU;In Russian)
Investigation on the ^{196m198m}Au decay, 18:34187 (RA;RU;In Russian)
Ion implantation in semiconductors at high temperatures, 18:34480 (RA;RU;In Russian)
Isomer ratio dependence on neutron energy in the ^{197}Au(n,γ)$^{198m'g}$Au, 18:34287 (RA;RU;In Russian)
Isomer ratio of the ^{118}Sn(γ,p)^{117m,g}In, 18:34295 (RA;RU;In Russian)
Isomer ratios in proton and deuteron reactions, 18:34286 (RA;RU;In Russian)
Isomer ratios of ^{98}Mo(γ,p) ^{97m,g}Nb reaction yield, 18:34306 (RA;RU;In Russian)
Isomeric ratios of the ^{96}Mo(γ,p) ^{95m,g}Nb reaction, 18:34307 (RA;RU;In Russian)
Isoscalar dipole states and the ^{18}O nucleus polarizability, 18:34106 (RA;RU;In Russian)
Isotopic dependence of cross sections of neutron scattering on Ge and Se even isotopes, 18:34272 (RA;RU;In Russian)
Isovector monopole resonances in nuclei with giant neutron halos, 18:34148 (RA;RU)
J matrix formalism in three-body problem, 18:34225 (RA;RU;In Russian)
K capture probabilities at the ^{101}Rh decay, 18:34159 (RA;RU;In Russian)
K shell autoionization in the ^{141}Ce beta decay, 18:34165 (RA;RU;In Russian)
Large area silicon spectrometric detectors and the alpha detection equipment on their base, 18:33672 (RA;RU;In Russian)
Lifetime measurement of ^{102}Ru levels by the dsa method, 18:34075 (RA;RU;In Russian)
Lifetime measurements in quasirotational bands of $^{116'118}$Sn states, 18:34078 (RA;RU;In Russian)
Linear relations between masses and Coulomb-energy differences of terms of isobaric multiplets, 18:34099 (RA;RU;In Russian)
Low-energy giant resonances in spherical nuclei, 18:34134 (RA;RU;In Russian)
Low-lying 0$^+$-levels in magic nuclei and 2p2h correlations in ground state, 18:34136 (RA;RU;In Russian)
M1-transitions between high-spin states in ^{79}Kr, 18:34139 (RA;RU;In Russian)

M4-excitations of ^{10}B, 18:34105 (RA;RU;In Russian)
Magnetic characteristics of collective states of $^{160'162'164}Dy$ isotopes, 18:34135 (RA;RU;In Russian)
Magnetic dipole moments of the $^{147'149}Gd$ ground states, 18:34081 (RA;RU;In Russian)
Magnetic hyperfine fields on ^{181}Ta nuclei in $GdFe_2$ samples crystallized under high pressure from 3.0 to 6.3 GPa, 18:34464 (RA;RU;In Russian)
Magnetic properties of rotational band in ^{159}Tb, 18:34082 (RA;RU;In Russian)
Mean-square radii and quadrupole moments of uranium isotopes, 18:34090 (RA;RU;In Russian)
Measurement of characteristics of the precise spectrometric americium-241 alpha source, 18:32625 (RA;RU;In Russian)
Measurement of charge radii of Hf nuclei by laser resonance fluorescence method, 18:34431 (RA;RU;In Russian)
Measurement of isotope shifts and hyperfine splitting for ytterbium neutron-deficient isotopes by means 0f high-sensitivity atomic spectroscopy, 18:34171 (RA;RU;In Russian)
Measurement of partial cross sections of the $^{9}Be(d,p)^{10}Be$ reactions, 18:34407 (RA;RU;In Russian)
Measurement of the gadolinium characteristic radiation intensity on the ^{155}Eu decay, 18:33664 (RA;RU;In Russian)
Measurement of the KX- and soft gamma radiation component intensity on the ^{153}Gd decay, 18:33665 (RA;RU;In Russian)
Measurement of the triton production cross sections in interaction of deuterons with ^{9}Be, 18:34405 (RA;RU;In Russian)
Mechanisms of nuclear reactions induced by ^{14}N ions on light nuclei, 18:34344 (RA;RU;In Russian)
Mechanisms of the $^{12}C+^{14}Ni$ reactions of $E(^{14}E)$=13- MeV, 18:34345 (RA;RU;In Russian)
Mechanisms of the ^{3}He, ^{6}Li and (^{H}e, ^{7}Be) reactions on the ^{16}O and ^{28}Si, 18:34303 (RA;RU;In Russian)
Method of dispersion integration on masses of complex particles in application to deuteron breakup, 18:34363 (RA;RU;In Russian)
Microscopic approach of point-mass density distribution of the ^{4}He nucleus, 18:34096 (RA;RU;In Russian)
Microscopic derivation of the collective Hamiltonian for quadrupole vibrations of even-even nuclei, 18:34098 (RA;RU;In Russian)
Microscopic description of giant resonance widths in magic nuclei, 18:34113 (RA;RU;In Russian)
Microscopic description of nonadiabatic behaviour of E2-transitions in the rare-earth nuclei, 18:34192 (RA;RU;In Russian)
Microscopic description of properties of ^{177}Hf low-lying states, 18:34086 (RA;RU;In Russian)
Microscopic description of the halo effect, 18:34094 (RA;RU;In Russian)
Microscopic description of the proton-light nuclei diffraction interaction, 18:34385 (RA;RU;In Russian)
Mixed representation for the heavy ion transfer process amplitudes, 18:34395 (RA;RU;In Russian)
Moessbauer study of the fabrication place of Dutch tile found in the lower castlee of Vilnius, 18:33302 (RA;RU;In Russian)
Momentum distribution of nucleons and clusters in atomic nuclei, 18:34127 (RA;RU;In Russian)
Momentum transfer in mean energy proton reactions with heavy nuclei, 18:34275 (RA;RU;In Russian)
Multi-phonon version of the coupled channel method and cross section analysis of low-energy neutron inelastic scattering by spherical nuclei, 18:34388 (RA;RU;In Russian)
Multipurpose installation for applied investigation on the U-240 cyclotron, 18:33593 (RA;RU;In Russian)
Nature of nuclear collective modes of negative parity, 18:34191 (RA;RU;In Russian)
Neutron activation analysis of the moss and forest litter for environment radiation monitoring, 18:33304 (RA;RU;In Russian)
Neutron-rich nuclei in a magic region near ^{132}Sn, 18:34079 (RA;RU;In Russian)
New band with $K^{\pi}=1^{-}$ band on 1513.900 keV level in ^{178}Hf, 18:34087 (RA;RU;In Russian)
New estimation of the characteristics values of decay and radiation $^{44}Ti+^{44}Sc$, ^{51}Cr, $^{113}Sn+^{113m}In$, 18:34217 (RA;RU;In Russian)
New magic numbers in the atomic nucleus, 18:34069 (RA;RU;In Russian)
New mechanism of the large angle scattering, 18:34312 (RA;RU;In Russian)
New method of theoretical γ-spectroscopy, 18:34181 (RA;RU;In Russian)
NMR studies of steel type EhK-73 alloying with chromium and associated processes, 18:33177 (RA;RU;In Russian)
Nuclear gamma-transitions in condensed media, 18:34199 (RA;RU;In Russian)
Nucleon decay of giant resonances, 18:34131 (RA;RU;In Russian)
Observation of rainbow scattering, 18:34313 (RA;RU)
Occupation of ^{114}Te levels in the alpha reactions, 18:34077 (RA;RU;In Russian)
Occupation of ^{27}Al levels in the $(n,n'\gamma)$ reaction, 18:34068 (RA;RU;In Russian)
Occupation of ^{52}Cr levels in the $(n,n'\gamma)$ reaction with reactor fast neutrons, 18:34247 (RA;RU;In Russian)
Occupation of ^{77}Se excited states in the $(n,n'\gamma)$ reaction with reactor fast neutron beam, 18:34248 (RA;RU;In Russian)
Off-energy-shell behaviour of KN, πN and NN scattering amplitudes in one-meson exchange model, 18:34226 (RA;RU;In Russian)
On a possibility of a direct experimental observation of the delayed fission effect of excited heavy nuc'ei by means of the shadow method, 18:34349 (RA;RU;In Russian)
On angular correlations between fragments and charged particles emitted during uranium fission by protons at E_p=153 MeV, 18:34289 (RA;RU;In Russian)
On measurement of particle masses, knocked out from Au targets by high-energy heavy ions, 18:33673 (RA;RU;In Russian)
On positron states in superconductor superlattices, 18:34452 (RA;RU;In Russian)
On self-consistent approaches to IAR theory, 18:34129 (RA;RU;In Russian)
On some regularities of the decay of input states produced in the (γ,n) reaction in the 1f 712 shell regin of nuclei, 18:34211 (RA;RU;In Russian)
On the contribution nuclear unbound states of the $^{6}Li^{*}$ in the inclusive deuteron spectra from (α,d) reactions on ^{3}He and ^{3}He nuclei, 18:34328 (RA;RU;In Russian)
On the D+D fusion reaction, 18:34374 (RA;RU;In Russian)
On the data authenticity of most commonly used tables on internal conversion coefficients, 18:34197 (RA;RU;In Russian)
On the mechanism of α-particle scattering by ^{16}O nuclei at E_{α}=25 MeV, 18:34318 (RA;RU;In Russian)
On the mechanism of a regular spin splitting of cross sections and the Te(n,p)m Sn(p,n) reaction cross sections, 18:34274 (RA;RU;In Russian)
On the mechanism of inelastic scattering according to the data on occupation probability of 2_1^+ level substates in the $^{24}Mg(p,p')$ reaction near resonance at E_p=5.903 MeV, 18:34271 (RA;RU;In Russian)
On the polarized electron scattering by oriented nuclei, 18:34367 (RA;RU;In Russian)
On the probability of ^{235}U isomeric transition in silver, 18:34196 (RA;RU;In Russian)
On the problem of isomer ratios in the (γ,γ') reaction in the 4-9 MeV range, 18:34293 (RA;RU;In Russian)
On-line system for mass analysis of the gamma-emitting isotope content in environment samples, 18:33666 (RA;RU;In Russian)
One-nucleon transfer reaction on the ^{94}Zr and ^{96}Zr isotopes, 18:34325 (RA;RU;In Russian)
Optical method for calculation of the compound process cross sections, 18:34382 (RA;RU;In Russian)
Optical model description of deuteron elastic scattering on ^{9}Be, 18:34235 (RA;RU;In Russian)
Optical potential and t matrix of neutron-nucleus scattering in Hartree-Fock approximation, 18:34383 (RA;RU;In Russian)
Orientation dependence of ^{19}F nucleus E1 and E2 multipolarity level Coulomb excitation cross section relationships in crystals, 18:34475 (RA;RU;In Russian)
Orthopositronium decay accompanied by excitation of nucleus or atomic shell, 18:34448 (RA;RU;In Russian)
Orthopositronium decay stimulated by laser radiation, 18:34449 (RA;RU;In Russian)

P-odd effects in neutron interactions with ^{117}Sn and ^{139}La nuclei and negative resonance positions, 18:34378 (RA;RU;In Russian)
Parametrization of radiative transitions in high-spin rotational band with alignment of internal angular moment, 18:34174 (RA;RU;In Russian)
Partial cross sections for the ^{45}Sc(p,γ)^{46}Ti reaction at low energy of protons, 18:34258 (RA;RU;In Russian)
Partial cross sections of the (p,n) reaction on ^{71}Ga, 18:34261 (RA;RU;In Russian)
Particle emission in quasi-fission reactions, 18:34394 (RA;RU;In Russian)
Peculiarities of refractive and diffractive contributions to cross sections of the α-particles elastic rainbow scattering by deformed nuclei, 18:34317 (RA;RU;In Russian)
PhAZA - 4π installation for study on the fragments multiplex emission in nucleus-nucleus collisions, 18:33659 (RA;RU;In Russian)
Photodisintegration of ^{236}U nucleus near threshold by linearly polarized photons, 18:34249 (RA;RU;In Russian)
Photodisintegration of ^{16}O nucleus in J matrix method, 18:34375 (RA;RU;In Russian)
Photoexcitation of the ^{190m}Os and ^{203}Pb in the 8-11 MeV range of γ-quanta, 18:34298 (RA;RU;In Russian)
Photonuclear reactions of (γ,pxn) type on ^{112}^{8}Sn nucleus, 18:34308 (RA;RU;In Russian)
Photonuclear reactions: energy resolution and cross section structure, 18:34304 (RA;RU;In Russian)
Physical basis of the production and employment of ultracold (UCN) very cold (UCN) neutrons at accelerator beams and at thermonuclear reactors, 18:33455 (RA;RU;In Russian)
Pion production in the A(γ,πN)B reaction, 18:34290 (RA;RU;In Russian)
Position sensitive detector on the microchannel plates with different systems of data readout, 18:33662 (RA;RU;In Russian)
Positron annihilation process using for porous size determination, 18:34465 (RA;RU;In Russian)
Positrons sound superconductivity, 18:34451 (RA;RU;In Russian)
Possibilities of application of the backscattering method for control of the integral circuit technological layers, 18:32626 (RA;RU;In Russian)
Possible manifestation of electrodynamics parameters in nuclear states energies and particle masses, 18:34054 (RA;RU;In Russian)
Potential description of light nucleus electrodisintegration, 18:34377 (RA;RU;In Russian)
Precise method for operative measurement of material absorption properties for γ- and β-radiations, 18:34402 (RA;RU;In Russian)
Probabilities of beta-transitions in dynamical collective model, 18:34208 (RA;RU;In Russian)
Production and investigation on the beam of circularly polarized shower γ-quanta in crystal media, 18:34418 (RA;RU;In Russian)
Production of quasimonochromatic gamma radiation for nuclear spectroscopy purpose, 18:33993 (RA;RU;In Russian)
Properties of ^{48}Ti excited states from the (n,n'γ) reaction, 18:34246 (RA;RU;In Russian)
Proton polarization in the ^{12}C(K$^+$, K$_p^+$)^{11}B reaction at 0.6 and 0.85 GeV/c initial kaons, 18:34359 (RA;RU;In Russian)
Proton polarization in the d(K$^+$, K$^+$p)n reaction at 0.6 GeV/c kaon momentum, 18:34360 (RA;RU;In Russian)
Proton reactions rates on nuclei ^{6}Li, ^{7}Li and ^{9}Be, 18:34408 (RA;RU;In Russian)
Proton-neutron interactions and masses of nuclei with Z>N, 18:34112 (RA;RU;In Russian)
Quasi-free capture by clusters and rescattering process in pion-nucleus absorption reactions, 18:34284 (RA;RU;In Russian)
Quasivibrational and nonvibrational 4$^+$ states of ^{56}Fe in the (antip,p') scattering at θ_p=16 MeV, 18:34264 (RA;RU;In Russian)
Radiation-induced current-transport in metal-dielectric-semiconductor structures, 18:34477 (RA;RU;In Russian)
Radiative proton capture by ^{69}Ga nuclei, 18:34260 (RA;RU;In Russian)
Radiative strength functions for E1-transitions of some nuclei, 18:34155 (RA;RU;In Russian)
Radioactive sodium isotope separation by means of light-induced drift, 18:32617 (RA;RU;In Russian)
Rainbow scattering of radioactive nuclei, 18:34352 (RA;RU)
Ratios of decay probabilities of ^{8}Be* high-excited states in the ^{10}B(d,α)2α and ^{10}B(d,α)p, ^{7}Li reactions, 18:34329 (RA;RU;In Russian)
Reaction mechanisms of inelastic pion-nucleus scattering at intermediate energies, 18:34282 (RA;RU;In Russian)
Recursion mass formula for heavy even-even isotopes, 18:34100 (RA;RU;In Russian)
References for beta-spectrometer calibration in low-energy range, 18:33663 (RA;RU;In Russian)
Refraction effects in the ^{3}He, ^{3}He,^{3}He' and (^{3}He,α) reactions on ^{30}Si nuclei at E(^{3}He)=60 MeV, 18:34332 (RA;RU;In Russian)
Resonance scattering of alpha-particles on oxygen and its use in nuclear microanalysis, 18:33301 (RA;RU;In Russian)
Resonances in the ^{36}S(pγ)^{37}Cl, 18:34144 (RA;RU;In Russian)
Role of final-state NN interaction in the ^{6}He(2$^+$),^{6}Li (2$^+$,T=1) and ^{6}Be(2$^+$) three-particle decays, 18:34213 (RA;RU;In Russian)
Role of multiple exchange of nucleon in the ^{16}O(d,p)^{17}O* stripping in the polarization characteristics calculation, 18:34403 (RA;RU;In Russian)
Role of nuclear relativism in calculations of magnetic form factors, 18:34093 (RA;RU;In Russian)
Role of quantum fluctuations in decay of double nuclear system, 18:34390 (RA;RU;In Russian)
Rotational interpretation of ^{192}Ir, 18:34088 (RA;RU)
Rotational interpretation of ^{194}Ir, 18:34089 (RA;RU)
Rotational-vibrational excited states of deformed even-even nuclei, 18:34111 (RA;RU;In Russian)
Scattering of vector charged particles in nucleus Coulomb field, 18:34227 (RA;RU;In Russian)
Scheme of decay of the 7937 keV ^{158}Gd compound state excited in (n,γ) reaction, 18:34173 (RA;RU;In Russian)
Scintillation detectors of charged particles with application of natural diamond crystal, 18:33668 (RA;RU;In Russian)
Search for excited states of ^{6}He rotating to the soft mode of dipole resonance, 18:34342 (RA;RU;In Russian)
Search for the isotopic effect in the 40 MeV deuteron disintegration in interactions with ^{58}Ni and ^{64}Ni nuclei, 18:34333 (RA;RU;In Russian)
Selected intervals in distribution of high-excited nuclear level distances (2), 18:34076 (RA;RU;In Russian)
Selection rules in isospin and the widths of high-excited states for light nuclei, 18:34092 (RA;RU;In Russian)
Self-consistent description of pair correlation effects with semiphenomenological nucleon-nucleon forces, 18:34141 (RA;RU;In Russian)
Self-consistent potential of atomic nuclei and fragmentation effects, 18:34115 (RA;RU;In Russian)
Semiclassical calculation of collective motion parameters of 'cold' nuclei, 18:34130 (RA;RU;In Russian)
Sensitivity analysis of reaction cross section and zero-angle scattering amplitude to structure of nuclear optical potential for 1.37 GeV alpha particles, 18:34368 (RA;RU;In Russian)
Shaking-off nucleons with weakly coupled projectile and their rescattering in the nucleus-target field, 18:34391 (RA;RU;In Russian)
Shell effects and production cross sections of the Fr, Ra, and Ac neutron-deficient isotopes with N=126 in the ^{197}Au+^{20},^{22}Ne reactions, 18:34354 (RA;RU;In Russian)
Shell structure influence on distribution of excitation energy between nuclei, 18:34397 (RA;RU;In Russian)
Shell structure of ^{12}C nucleus and slow π^--meson absorption, 18:34358 (RA;RU;In Russian)
Simple microscopic model of beta-decay strength function, 18:34188 (RA;RU;In Russian)
Soft dipole resonance in ^{11}Li in three-particle cluster model with continuous spectrum, 18:34097 (RA;RU;In Russian)
Solution of the inverse scattering problem in flameworks of the P-matrix approach, 18:33988 (RA;RU;In Russian)
Spectra of $\gamma\gamma$-coincidences of ^{187}W in (n,γ) reaction, 18:34186 (RA;RU;In Russian)
Spectra of γ-γ coincidences for ^{124}Te in the (n,γ) reaction, 18:34163 (RA;RU;In Russian)
Spectra of the ^{9}Be and ^{9}B nuclei in the three-particle multicluster model, 18:34101 (RA;RU;In Russian)

Spectroscopic factors and classification of cluster decays of even-even nuclei, 18:34194 (RA;RU;In Russian)
Spin-isospin response of nucleus in process of the single charge-exchange pion, 18:34380 (RA;RU;In Russian)
Spin-neutrino angular correlations at muon capture in ^{28}Si, 18:34254 (RA;RU;In Russian)
Spontaneous and induced two-body fragmentation, 18:34216 (RA;RU;In Russian)
Stabilizing shell effect and unified character of its parameters, 18:34067 (RA;RU;In Russian)
Standard isotopic x-radiation sources (SIXRS), 18:32624 (RA;RU;In Russian)
Stochastic approach to description of nuclear collective motion, 18:34117 (RA;RU;In Russian)
Stochastic model of heated fissile nucleus relation, 18:34399 (RA;RU;In Russian)
Strength functions of β^+ (electron capture) decays and delayed fission of neutron-deficient pre-actinide nuclei, 18:34177 (RA;RU;In Russian)
Structure of resonance state wave functions in continuum range for 1d-2s shell nuclei, 18:34150 (RA;RU;In Russian)
Structure of the (γ,n) cross sections on ^{90}Zr, 18:34300 (RA;RU;In Russian)
Structure of the (γ,n) cross section on ^{116}Sn, 18:34301 (RA;RU;In Russian)
Structure of the (γ,n) reaction cross section on ^{142}Nd, 18:34299 (RA;RU;In Russian)
Study of anomalous proton optical potential near Fermi energy, 18:34267 (RA;RU;In Russian)
Study of energy dependence of B type pair coherent production in Ge crystal, 18:34482 (RA;RU;In Russian)
Study of long-lived charge exchange of carbon foils, 18:33270 (RA;RU;In Russian)
Study of NGR factors determining Fe-W alloy formation at laser synthesis, 18:33178 (RA;RU;In Russian)
Study of P-even angular asymmetry of ^{235}U fission fragments spread relatively to the direction of a slow neutron beam in the energy range 1 to 136 eV, 18:34276 (RA;RU;In Russian)
Study of relative neutron and proton yields in the (p,pn) and (p,2p) reactions, 18:34270 (RA;RU;In Russian)
Study of the ^{12}(γ,π^-p) reaction in a wide range of kinematic variable variations, 18:34291 (RA;RU;In Russian)
Study of the (K^+,K_n) reaction at 60 MeV, 18:34279 (RA;RU;In Russian)
Study of the dispersion corrections role in the inelastic proton scattering on ^{28}Si at E-p<30 MeV, 18:34281 (RA;RU;In Russian)
Study on a density of the excited strongly-deformed states of the actinide nuclei, 18:34147 (RA;RU;In Russian)
Study on nuclear multifragmentation by means of 4π-phase facility, 18:34339 (RA;RU;In Russian)
Study on the ^{11}Li nuclear structure in the ^{11}B+^{14}C reaction, 18:34343 (RA;RU;In Russian)
Study on the ^{16}O(d,p)^{17}O* stripping in the frame of different approaches, 18:34233 (RA;RU;In Russian)
Study on the ^{177}Lu in (n,2γ) reaction, 18:34179 (RA;RU;In Russian)
Study on the (α, ^{3}He) reaction on the ^{16}O, ^{28,30}Si, ^{32}S nuclei the ^{30}Si at 50.5 MeV, 18:34221 (RA;RU;In Russian)
Study on the A(^{11}Li, ^{9}Li) reaction mechanisms and ^{11}Li nucleus structure, 18:34393 (RA;RU;In Russian)
Study on the beta and gamma isotope concentration in environment beyond the 30 km Chernobyl NPP accident zone, 18:33811 (RA;RU;In Russian)
Study on the electronic shell reconstruction influence on the low-energy conversion transition in ^{90m}Tc, 18:34206 (RA;RU;In Russian)
Study on the nuclear fission in the region of the Busonaro-Gallone point, 18:34347 (RA;RU;In Russian)
Study on the reaction product spectra at high excitation energies of nuclei, 18:34400 (RA;RU;In Russian)
Study on the two-nucleon transfer reactions by means of the ^{6}He secondary beams, 18:34341 (RA;RU;In Russian)
SU_3 band mixing effects in the framework of strictly restricted dynamics model, 18:34109 (RA;RU)
Subbarrier fusion of identical heavy nuclei, 18:34396 (RA;RU;In Russian)
Superconducting detectors of nuclear particles, 18:33675 (RA;RU;In Russian)
Surface and inner excitation of 2$^+$ states in ^{28}Si in inelastic proton scattering, 18:34263 (RA;RU;In Russian)
T-matrix approximation for description of (d, dp) and (α, αp) reactions on light nuclei at mean energies, 18:34365 (RA;RU;In Russian)
Tables of internal conversion coefficients in Dirac-Fock field for observed high-multipolarity nuclear transitions, 18:34432 (RA;RU;In Russian)
Taking corrections for inelastic scattering of deuterons and α-particles on light nuclei at mean energies, 18:34376 (RA;RU;In Russian)
Tantalum nitriding study by average energy proton nucleus backscattering, 18:33226 (RA;RU;In Russian)
Technique of study on quasicontinuous gamma spectra in inelastic nucleon-atomic nuclei interaction, 18:33669 (RA;RU;In Russian)
Technique of the characteristic radiation apparatus spectra processing in X-ray spectral analysis by means of a Si(Li) detector, 18:33671 (RA;RU;In Russian)
Temperature-dependent 'surface tension' in the ideal Fermi gas model, 18:34124 (RA;RU;In Russian)
The quadrupole and octupole excitations of ^{162,164}Dy, 18:34084 (RA;RU)
The role of final-state interaction of n+d subsystem in deuterium breakup reaction on deuterons at 13.6 MeV, 18:34269 (RA;RU;In Russian)
Theoretical interpretation of semiempirical formula for total cross sections of nucleus-nucleus reactions, 18:34398 (RA;RU;In Russian)
Theoretical investigation of gamma radiation of excited nuclei in the $\gamma A \rightarrow \pi A^*$ reactions, 18:34387 (RA;RU;In Russian)
Threshold effects in compound reactions followed by fission, 18:34406 (RA;RU;In Russian)
Total absorption spectrometer for measurement of the beta-decay force function, 18:33661 (RA;RU;In Russian)
Total cross sections from the (p,n) reaction on molybdenum isotopes at E_p=5-6 MeV, 18:34266 (RA;RU;In Russian)
Total cross sections of the ^{3}He reactions with nuclei, 18:34319 (RA;RU;In Russian)
Transitions between the 7/2$^+$ (633) and 7/2$^-$ (514) bands in ^{177}Hf, 18:34180 (RA;RU;In Russian)
Tritium beta-decay with beta-electron transition into bound state, 18:34200 (RA;RU;In Russian)
Two-center model of rotational states in atomic nuclei, 18:34143 (RA;RU;In Russian)
Two-neutrino double beta decay of ^{110}Mo in ^{100}Ru excited states, 18:34195 (RA;RU;In Russian)
Two-particle photodisintegration of three-nucleon nuclei and polarization phenomena at low energies, 18:34370 (RA;RU;In Russian)
Two-photon 0$^+$-0$^+$ transition in ^{90}Zr, 18:34204 (RA;RU;In Russian)
Two-quasiparticle spectra in the range of $_{50}{}^{132}$Sn$_{82}$, 18:34125 (RA;RU;In Russian)
Unified approach to description of the nuclear dynamics and properties of the ground state, 18:34091 (RA;RU;In Russian)
Unified mechanism of changes of radiation-induced surface state spectrum and oxide charge in Si-SiO_2 system, 18:34478 (RA;RU;In Russian)
Use of helium ions backscattering method for determination of gold content in ores, 18:33299 (RA;RU;In Russian)
Using the real nuclear Hamiltonian for analysis of nucleon scattering by nonaxial deformed even-even nuclei, 18:34384 (RA;RU;In Russian)
Variable moment of inertia model for description of odd nuclei rotation, 18:34128 (RA;RU;In Russian)
Vectorial interaction in the strictly restricted dynamics model, 18:34108 (RA;RU)
Vertex constants and spectroscopic factors from the ^{3}He,d reaction analysis on the ^{9}Be and ^{11}B nuclei, 18:34330 (RA;RU;In Russian)
Vibrational 0$^+$-4$^+$ excitations in spherical nuclei, 18:34133 (RA;RU;In Russian)

Vibrational states effect on thermodynamic characteristics of heated nuclei, 18:34120 (RA;RU;In Russian)
Wave function structure of the ^{6}He and ^{11}Li nuclei, 18:34095 (RA;RU;In Russian)
Wide-aperture coordinate scintillation spectrometer, 18:33670 (RA;RU;In Russian)
Woolf-Bragg scattering of alpha-particles on nuclei, 18:34228 (RA;RU;In Russian)
Y-distributions of electrons from νe and antiνe scatterings as test for study of standard electroweak model, 18:34045 (RA;RU;In Russian)
Yields of rare earth elements in the ^{238}U photofission, 18:34250 (RA;RU;In Russian)
Yrast band of ^{93}Nb, 18:34158 (RA;RU;In Russian)

Guidelines for mixed waste minimization, 18:32376 (R;US)
GWSCREEN: A semi-analytical model for assessment of the groundwater pathway from surface or buried contamination: Version 2.0 theory and user's manual, 18:32409 (R;US)
HYLIFE-II tritium management system, 18:34600 (R;US)
Idaho National Engineering Laboratory Waste Management Operations Roadmap Document, 18:32374 (R;US)
IMCS: Item Management Control System, 18:34657 (CM;US)
INEL BNCT Research Program, March/April 1993, 18:33865 (R;US)
Measured thermal and fast neutron fluence rates ATR Cycle 100-A: Internal technical report, March 15, 1993–April 22, 1993, 18:32834 (R;US)
Neutronics and fuel behavior of AIROX-processed fuel recycled into light water reactors, 18:32340 (R;US)
Operating experience of natural circulation core cooling in boiling water reactors, 18:32917 (R;US)
Performance indicators for 1st quarter CY 1993, 18:32918 (R;US)
Summary of activities to remove the aircraft hydrant system (Panero site) at March Air Force Base, California, 18:32306 (R;US)
System to control contamination during retrieval of buried TRU waste, 18:32568 (PA;US)
Systems engineered health and safety criteria for safety analysis reports, 18:32558 (R;US)
Temperatures and heat flow in INEL-GT1 and WO-2 boreholes, Snake River Plain, Idaho, 18:32723 (R;US)
Test Plan for the overburden removal demonstration, 18:32559 (R;US)
The United States Department of Energy (DOE) Computerized Accident/Incident Reporting System (CAIRS), 18:32557 (R;US)
Travel to Bulgaria to attend workshop on safety review and inspection in nuclear power plant operation: Foreign trip report, May 18–22, 1992, 18:32912 (R;US)
Travel to France to attend conference on Irradiation Technology: Foreign trip report, May 20–22, 1992, 18:32826 (R;US)
Travel to Germany as a safety representative of the Joint Central Team (JCT) of the International Thermonuclear Experimental Reactor (ITER): Foreign trip report, July 10–17, 1993, 18:34599 (R;US)
Travel to Germany to participate in the 4th International KfK/TNO conference on contaminated soil: Foreign trip report, May 3–7, 1993, 18:33802 (R;US)
Travel to Korea to discuss the RELAP5/MOD3 code at the Korea Atomic Energy Research Institute: Foreign trip report, June 14–20, 1992, 18:32911 (R;US)
Travel to the Netherlands to perform neutron and gamma field measurements at the High Flux Reactor: Foreign trip report, April 19–23, 1993, 18:32622 (R;US)
[Travel to Germany to attend meeting of the Technical Advisory Committee to the International Thermonuclear Experimental Reactor Council]: Foreign trip report, March 13–18, 1993, 18:34591 (R;US)

EG and G Rocky Flats, Inc., Golden, CO (United States)
Human factoring the procedures element in a complex manufacturing system, 18:33388 (R;US)
Rebaselining seismic risks for resumption of Building 707 plutonium operations at the Rocky Flats Plant, 18:33003 (R;US)
Report on the effectiveness of flocculation for removal of ^{239}Pu at concentrations of 1 pCi/L and 0.1 pCi/L: RFP Pond Water Characterization and Treatment (LATO-EG&G-91-022): Task C deliverables: 5.1.2 and 5.2.2, 18:32416 (R;US)

EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant
Effect of internal heating during hot compression testing on the stress-strain behavior and hot working characteristics of Alloy 304L, 18:33194 (R;US)
Systematic Evaluation Program (SEP) at Rocky Flats Plant: An overview of practical management issues for evaluation of natural phenomena hazards, 18:32574 (R;US)
The effects of size reduction techniques on TCLP analysis of solidified mixed waste, 18:32468 (R;US)
The Rocky Flats Plant Independent Safety Review system: An implementation of DOE 5480.5, 5480.6, and 5482.1B, 18:32572 (R;US)
The safety climate of a Department of Energy nuclear facility: A sociotechnical analysis, 18:32573 (R;US)

EIC Labs., Inc., Norwood, MA (United States)
Fiber optic Raman spectrograph for in situ environmental monitoring: Final report, 18:33292 (R;US)

Elsamprojekt A/S, Fredericia (Denmark)
The use of straw in primary power plants, 18:32667 (R;DK;In Danish)

EME Group, New York, NY (United States)
Analysis of fuel savings associated with fuel computers in multi-family buildings: Final report, 18:33091 (R;US)
Energiministeriet, Copenhagen (Denmark)
Energy 2000: Status for meeting the requirements, 18:33032 (R;DK;In Danish)
Energistyrelsen, Copenhagen (Denmark)
Catalogue of ideas: Introduction to the conference of June 13th-14th, 1993, on the follow up of "Energy 2000", 18:33024 (R;DK;In Danish)
Decentral cogeneration of electric power and heat in Denmark, 18:33021 (I;DK;In Danish)
Decentral cogeneration of heat and electricity: Note on status, 18:33108 (I;DK;In Danish)
Energy development up to the year 2005: Introduction to the conference of June 14th-15th, 1993, on the follow up of Energy 2000, 18:33023 (R;DK;In Danish)
Energistyrelsen, Copenhagen (Denmark). VE-Raadet
Report on the status of renewable energy in Denmark, 18:33049 (R;DK;In Danish)
Energy and Environmental Research Corp., Irvine, CA (United States)
Enhancing the use of coals by gas reburning-sorbent injection: Quarterly report No. 23, April 1–June 30, 1993, 18:32227 (R;US)
Evaluation of gas-reburning and low NO_x burners on a wall fired boiler: Technical progress report No. 11, April 1–June 30, 1993, 18:32234 (R;US)
Energy International Corp., Pittsburgh, PA (United States)
Rawlins UCG Demonstration Project: Final technical progress report, January 1, 1987–February 9, 1988, 18:32160 (R;US)
Energy International, Inc., Pittsburgh, PA (United States)
Characterization and supply of coal based fuels: Quarterly report, November 1, 1986–January 31, 1987, 18:32188 (R;US)
Characterization and supply of coal-based fuels: Quarterly report, August 1, 1989–October 31, 1989, 18:32233 (R;US)
Energy International, Inc., Rawlins, WY (United States)
[Underground gasification of steeply dipping coal beds]: [Quarterly report, February 10, 1988–May 9, 1988], 18:32161 (R;US)
Engineering Computer Optecnomics, Inc., Annapolis, MD (United States)
Road Transportable Analytical Laboratory (RTAL) system: Quarterly technical report, September–November 1992, 18:33294 (R;US)
Road Transportable Analytical Laboratory (RTAL) system: Quarterly technical report, December 1992–February 1993, 18:33805 (R;US)
ERC Environmental and Energy Services Co., Albuquerque, NM (United States)
Leak-before-break issue, 18:32921 (R;US)
ERG International, Inc., Golden, CO (United States)
Building integrated photovoltaic systems analysis: Preliminary report, 18:32695 (R;US)
Ernst Mach Inst., Freiburg (Germany)
Dense gas boundary layer experiments: Visualization, pressure measurements, concentration evaluation, 18:33421 (R;US)

F

Fauske and Associates, Inc., Burr Ridge, IL (United States)
Summary report on 49 L ferrocyanide aerosol tests TO208-1 and TO209-1, 18:32508 (R;US)
Fermi National Accelerator Lab., Batavia, IL (United States)
A multi-thread approach to coalescing small transfers generated by portable tool sets, 18:34659 (R;US)
Beam transfer at E0: An overview, 18:33587 (R;US)
Beta measurements and modeling the Tevatron, 18:33505 (R;US)
Charmonium physics from $\bar{p}p$ interactions, 18:34042 (R;US)
Chromaticity compensation scheme for the Main Injector, 18:33504 (R;US)
Effects of transverse coupling on transverse beam size, simulation and measurements, 18:33639 (R;US)
Electrical design note for a 5000 ADC, 230 μH power supply filter choke, 18:33589 (R;US)
Fast sampling calorimetry with solid argon ionization chambers, 18:33650 (R;US)
Impedance issue of corrugated beam pipe from CDF, 18:33590 (R;US)
Overview of accelerators in medicine, 18:33476 (R;US)
QCD tests and new physics search with jets at CDF, 18:34031 (R;US)
Ratios of cross sections of carbon, calcium and lead at low x_{Bj} in inelastic muon scattering, 18:34043 (R;US)
Reliability of the Fermilab Antiproton Source, 18:33586 (R;US)
SUSY searches at CDF, 18:34026 (R;US)
Tevatron reverse injection, 18:33588 (R;US)
The Fermilab 400-MeV Linac Upgrade, 18:33475 (R;US)
Travel to France for a seminar at DESY on early results from 1.8 TeV $\bar{p}p$ collisions at D0: Foreign trip report, March 7–21, 1993, 18:34041 (R;US)
Travel to Germany to attend conference on high energy accelerators: Foreign trip report, July 18–26, 1992, 18:33472 (R;US)
Travel to Germany to attend conference on particle accelerators: Foreign trip report, March 20–April 3, 1992, 18:33474 (R;US)
Travel to Italy for discussions about Si Strip Detectors and a presentation at the VI European Symposium on Semiconductor Detectors: Foreign trip report, February 21–27, 1992, 18:33654 (R;US)
Travel to Japan for the 15th meeting of US/Japan Committee on High Energy Physics: Foreign trip report, May 31–June 1, 1993, 18:34025 (R;US)
Travel to Switzerland to discuss several issues related to computer graphics technology in an effort to understand which direction CERN is moving in this area: Foreign trip report, March 8–16, 1992, 18:34649 (R;US)
[Cryostat project meetings and vendor visits in Italy and Germany]: Foreign trip report, September 7–22, 1992, 18:33583 (R;US)
Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project
1992 Fernald Site Environmental Report, 18:32562 (R;US)
Florida State Univ., Tallahassee, FL (United States)
Fast sampling calorimetry with solid argon ionization chambers, 18:33650 (R;US)
Florida State Univ., Tallahassee, FL (United States). Dept. of Physics
Experimental consequences of supersymmetry, 18:34022 (R;US)
High energy physics program: Task A, Experiment and theory; Task B, Numerical simulation: Progress report, July 1, 1988–June 30, 1993, 18:34014 (R;US)
Florida State Univ., Tallahassee, FL (United States). Supercomputer Computations Research Inst.
Study of $\pm J$ Ising spin glasses via multicanonical ensemble, 18:34455 (R;US)
Fluor Daniel, Inc., Irvine, CA (United States)
Shielded Canister Transporter, 18:33352 (R;US)
Foster Wheeler Development Corp., Livingston, NJ (United States)
Development of a high-performance coal-fired power generating system with pyrolysis gas and char-fired high temperature furnace (HITAF): Quarterly progress report No. 5, January–March 1993, 18:32754 (R;US)
Travel to England to present paper of DOE 2nd-Generation PFB Project Conference and visit British Coal Test facilities at Stoke Orchard and Grimethorpe: Foreign trip report, December 8–14, 1991, 18:32751 (R;US)
Foster-Miller, Inc., Waltham, MA (United States)
Evaluation and demonstration of decentralized space and water heating versus centralized services for new and rehabilitated multifamily buildings: Final report, 18:33046 (R;US)
Fraunhofer-Institut fuer Kurzzeitdynamik - Ernst-Mach-Institut (EMI), Freiburg im Breisgau (Germany)
Exploratory depth-of-burst experiments, 18:33721 (R;US)
Fusion Physics and Technology, Torrance, CA (United States)
Advanced fusion diagnostics: Final technical report, July 15, 1991–July 14, 1993, 18:34500 (R;US)

G

Gas Research Inst., Chicago, IL (United States)
Hydraulic fracture model comparison study: Complete results, 18:32317 (R;US)

General Atomics, San Diego, CA (United States)
Lower hybrid counter current drive for edge current density modification in DIII-D, 18:34523 (R;US)
Testing of ethylene propylene seals for the GA-4/GA-9 casks, 18:33371 (R;US)

General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation
Chemical Processing requirements HAPO New Production Reactor, 18:32894 (R;US)
Historical events of the Chemical Processing Department, 18:32342 (R;US)
Nuclear metallurgy lectures, 18:32893 (R;US)
Periodic and series reports Hanford Atomic Products Operation, 1943–1953, 18:32892 (R;US)
Tentative U-233 and thorium nitrate specifications, 18:32332 (R;US)
[Hanford Atomic Products Operations: 1962 annual report], 18:32895 (R;US)

General Electric Co., Schenectady, NY (United States)
Factors which affect fatigue strength of fasteners, 18:33188 (R;US)

General Motors Corp., Indianapolis, IN (United States). Allison Gas Turbine Div.
Preferential oxidation of methanol and carbon monoxide for gas cleanup during methanol fuel processing, 18:32633 (R;US)

Geological Survey of Japan, Tsukuba, Ibaraki (Japan)
Interim report on the 1991 research and development of the Sunshine Project.: Study on deep geothermal resource exploration technology, 18:32724 (I;JP;In Japanese)

Geological Survey, Idaho Falls, ID (United States)
Age dating ground water by use of chlorofluorocarbons (CCl_3F and CCl_2F_2), and distribution of chlorofluorocarbons in the unsaturated zone, Snake River Plain aquifer, Idaho National Engineering Laboratory, Idaho, 18:33804 (R;US)

George Washington Univ., Washington, DC (United States). Center for Nuclear Studies
Investigations of the structure and electromagnetic interactions of few-body systems: Progress report, 1 July 1992–30 June 1993, 18:34066 (R;US)

George Washington Univ., Washington, DC (United States). Dept. of Physics
A program in medium-energy nuclear physics: Progress report, August 1, 1991–August 31, 1992, 18:34061 (R;US)
A program in medium-energy nuclear physics: Progress report, September 1, 1992–June 30, 1993, 18:34062 (R;US)

Georgia Inst. of Tech., Atlanta, GA (United States)
Viscosity in the edge of tokamak plasmas, 18:34506 (R;US)

Georgia Inst. of Tech., Atlanta, GA (United States). School of Chemical Engineering
High temperature electrochemical separation of H_2S from coal gasification process streams: Quarterly progress report, October 1, 1992–December 30, 1992, 18:32166 (R;US)
High temperature membranes for H_2S and SO_2 separations: Quarterly progress report, January 1, 1993–March 31, 1993, 18:32163 (R;US)

Georgia State Univ., Atlanta, GA (United States). Dept. of Physics and Astronomy
[Heavy ion nuclear physics research]: Progress report, 1991–1992, 18:33651 (R;US)

Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Koeln (Gemany)
Reactor safety issues resolved by the 2D/3D Program: International Agreement Report, 18:32939 (R;US)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij
Electromagnetic disintegration of relativistic deuterons in amorphous and crystal targets and high-energy neutron beam formation, 18:33596 (RA;RU;In Russian)
Simulation of the forward calorimeter for LHC detector, 18:33656 (R;RU)

Groenlands Energiforsyning, Copenhagen (Denmark). Vandkraftafd.
Potentials for hydroelectric power and the giving of priority to the development of hydroelectric power in Greenland. 18:33042 (R;DK;In Danish)

GTE Labs., Inc., Waltham, MA (United States)
Analytical and experimental evaluation of joining silicon nitride to metal and silicon carbide to metal for advanced heat engine applications: Final report, 18:33236 (R;US)

H

Hanford Engineering Development Lab., Richland, WA (United States)
Data validation summary report 300-FF-5 round 5 groundwater, 18:32580 (R;US)
Electronic cone penetration testing at the Hanford Site, 200 West Area, 18:33833 (R;US)
Engineering evaluation of ruptured strainer in Building 309, 18:33373 (R;US)

Hanford Environmental Health Foundation, Richland, WA (United States)
Invited guest of British to assist with establishment of British equivalent of the United States Transuranium and Uranium Registries: Foreign trip report, October 30–November 9, 1991, 18:32545 (R;US)

Hanford Works, Richland, WA (United States)
P-10 research program in biology, 18:33924 (R;US)
Serious radiation event - Hanford capabilities, 18:32563 (R;US)

Harvard Univ., Boston, MA (United States). Harvard Air Cleaning Lab.
Proceedings of the 22nd DOE/NRC Nuclear Air Cleaning Conference, Sessions 1–8: Volume 1, 18:32820 (R;US)
Proceedings of the 22nd DOE/NRC Nuclear Air Cleaning Conference, Sessions 9–16: Volume 2, 18:32821 (R;US)

Harvard Univ., Cambridge, MA (United States)
A calorimeter for neutron flux measurement: Final report, 18:33678 (R;US)

Hawaii Natural Energy Inst., Honolulu, HI (United States)
Biomass Gasifier Facility (BGF): Environmental Assessment, 18:32639 (R;US)

Hawaii Univ., Honolulu, HI (United States). Dept. of Physics and Astronomy
Experimental consequences of supersymmetry, 18:34022 (R;US)

Health and Safety Executive, London (United Kingdom)
Statement of nuclear incidents at nuclear installations: second quarter 1992, 18:32776 (I;GB)
Statement of nuclear incidents at nuclear installations: fourth quarter 1992, 18:32341 (I;GB)

Heat Pipe Technology, Inc., Alachua, FL (United States)
Commercial high efficiency dehumidification systems using heat pipes, 18:33081 (R;US)

Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics
Code for calculation of spreading of radioactivity in reactor containment systems: TIBSO code, 18:32806 (R;HU)
Development of an X Window based operator's interface for a core monitoring system, 18:32774 (R;HU)
Extension of the Paks full-scale simulator to severe accidents, 18:32919 (R;HU)
Killing symmetries in neutron transport, 18:34421 (R;HU)
Modeling the cathode region of noble gas mixture discharges using Monte Carlo simulation, 18:34510 (R;HU)
Multi-heavy baryons in ultrarelativistic heavy ion collisions, 18:34033 (R;HU)
To the problem of the coherence length of neutrons, 18:34422 (R;HU)

Hydraulics Research Ltd., Wallingford (United Kingdom)
In situ erosion of cohesive sediment, 18:32732 (R;GB)

I

ICF Kaiser Engineers, Inc., Oakland, CA (United States)
Community Relations Plan for Lawrence Berkeley Laboratory: Environmental Restoration Program, 18:32987 (R;US)

ICF Kaiser Engineers, Inc., Pittsburgh, PA (United States)
LIFAC Sorbent Injection Desulfurization Demonstration Project: Quarterly report No. 10, January–March 1993, 18:32764 (R;US)

Idaho Univ., Moscow, ID (United States). Dept. of Physics
Electron impact excitation of copper atoms: Final report, 18:34443 (R;US)

Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States)
An attrition-resistant zinc titanate sorbent for sulfur: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32177 (R;US)
Analysis of organic sulfur and nitrogen in coal via tandem degradation methods: [Quarterly] technical report, March 1–May 31, 1993, 18:32195 (R;US)
Behavior of sulfur and chlorine in coal during combustion and boiler corrosion: [Quarterly] technical report, March 1–May 31, 1993, 18:32170 (R;US)
Biodesulfurization of mild gasification liquid products: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32174 (R;US)
Carbonation as a binding mechanism for coal/calcium hydroxide pellets: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32152 (R;US)
Characterization of available coals from Illinois mines: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32192 (R;US)
Clean, premium-quality chars: Demineralized and carbon enriched: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32151 (R;US)
Coal combustion under conditions of blast furnace injection: [Quarterly] technical report, 1 March 1993–31 May 1993, 18:32237 (R;US)
Combustion and emissions characterization of pelletized coal fuels: [Quarterly] technical report, March 1–May 31, 1993, 18:32150 (R;US)
Combustion properties of coal-char blends: NO_x emission characteristics: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32236 (R;US)
Development of an on-line image analysis for assessment of pyrite liberation: [Quarterly] technical report, March 1–May 31, 1993, 18:32153 (R;US)
Development of novel copper-based sorbents for hot-gas cleanup: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32176 (R;US)
Evaluation and utilization of Illinois FBC residues for construction materials: [Quarterly] technical report, March 1–May 31, 1993, 18:32240 (R;US)
Geochemistry of FBC waste-coal slurry solid mixtures: [Quarterly] technical report, March 1–May 31, 1993, 18:32238 (R;US)
Integrated methods for production of clean char and its combustion properties: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32239 (R;US)
Integrated production/use of ultra low-ash coal, premium liquids and clean char: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32171 (R;US)
Investigation of a sulfur reduction technique for mild gasification char: [Quarterly] technical report, March 1–May 31, 1993, 18:32172 (R;US)
Mass spectral study of organic sulfur in the polymeric matrix of coal: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32194 (R;US)
Microbial stabilization of sulfur-laden sorbents: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32203 (R;US)
Microbial strain improvement for organosulfur removal from coal: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32168 (R;US)
Mild temperature gasification: Partitioning sulfur to gas as H_2S: [Quarterly] technical report, March 1–May 31, 1993, 18:32173 (R;US)
Plasma-assisted cleanup of flue gas: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32202 (R;US)
Production of carbon molecular sieves from Illinois coal: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32197 (R;US)
Protocols for the selective cleavage of carbon-sulfur bonds in coal: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32193 (R;US)
Recovery and utilization of gypsum and limestone from scrubber sludge: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32766 (R;US)
Removal of CO_2 from flue gases by algae: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32765 (R;US)
Stabilization of spent sorbents from coal gasification: [Quarterly] technical report, March 1–May 31, 1993, 18:32178 (R;US)
Sulfur removal from high-sulfur Illinois coal by low-temperature perchloroethylene (PCE) extraction: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32169 (R;US)
Upgrading mild gasification liquids to produce electrode binder pitch: [Quarterly] technical report, March 1–May 31, 1993, 18:32175 (R;US)
Utilization of Illinois coal gasification slags for production of ultra-lightweight aggregates: [Quarterly] technical report, March 1–May 31, 1993, 18:33107 (R;US)
VHF EPR analysis of organic sulfur in coal: [Quarterly] technical report, March 1, 1993–May 31, 1993, 18:32196 (R;US)

Illinois Inst. of Tech., Chicago, IL (United States)
Surfactant-enhanced alkaline flooding for light oil recovery: [Quarterly] report, March 31–June 30, 1993, 18:32265 (R;US)

Illinois Univ., Chicago, IL (United States)
Regulation of cell division in higher plants: Progress report, 1993, 18:33861 (R;US)

Illinois Univ., Urbana, IL (United States)
Development of advanced direct perception displays for nuclear power plants to enhance monitoring, control and fault management: Progress report, 18:32817 (R;US)
Spin-mapping of coal structures with ESE and ENDOR: Final technical report, 18:32187 (R;US)

Imagination Resources, Inc., Dublin, OH (United States)
Measurement of viscosity, density, and gas solubility of refrigerant blends in selected synthetic lubricants: Quarterly report, March 1–June 30, 1993, 18:33083 (R;US)

Indiana Univ., Bloomington, IN (United States)
The partial Siberian snake experiment at the Brookhaven AGS, 18:33500 (R;US)

Indiana Univ., Bloomington, IN (United States). Dept. of Physics
Even order snake resonances, 18:33503 (R;US)
On the polarized beam acceleration in medium energy synchrotrons, 18:33502 (R;US)
Studies of polarized beam acceleration and Siberian Snakes, 18:33501 (R;US)

Inhalation Toxicology Research Inst., Albuquerque, NM (United States)
Dissolution rate and radiation dosimetry of metal tritides, 18:33956 (R;US)

Institute of Energy Economics, Tokyo (Japan)
Post-cold war European energy markets, 18:33040 (R;JP;In Japanese)

Safety study application guide: Safety Analysis Report Update Program, 18:32560 (R;US)

Massachusetts Executive Office of Consumer Affairs and Business Regulation, Boston, MA (United States). Div. of Energy Resources
No. 2 heating oil/propane program: Final report, 1992/93, 18:32293 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States)
Deformation mechanisms in a Laves phase, 18:33147 (R;US)
Linearity and calibration of charge-division and rise-time encoded gas PSDs, 18:33646 (R;US)
Morphology, deformation, and defect structures of $TiCr_2$ in Ti-Cr alloys, 18:33148 (R;US)
Scale models of circulating fluidized bed combustors: Simplification of the scaling laws and the scaling of convective heat transfer: Final report, 18:32224 (R;US)
Scaling of pressurized fluidized beds: First quarterly progress report, October 1, 1992–January 15, 1993, 18:32225 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center
Progress report of collaborative efforts at JET and PBX-M: Foreign trip report, August 30, 1991–February 20, 1992, 18:34598 (R;US)
The development of an Omegratron plasma ion mass spectrometer for Alcator C-Mod, 18:34501 (R;US)
Travel to England for discussion on magnet design options for ITER: Foreign trip report, April 28–May 3, 1992, 18:34592 (R;US)
Travel to England for meeting on ITER configuration: Foreign trip report, April 26–May 2, 1992, 18:34597 (R;US)

McDonnell Douglas Corp., St. Louis, MO (United States)
Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 1, Final report, 18:34588 (R;US)

McDonnell Douglas Corp., St. Louis, MO (United States). Aerospace Group
Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 2, Final report, 18:34589 (R;US)
Inertial Fusion Energy Reactor Design Studies: Prometheus-L, Prometheus-H: Volume 3, Final report, 18:34590 (R;US)

MCR Technology Corp., Chicago, IL (United States)
Genome sequencing by direct imaging x-ray color holography: Appendix A, 18:33862 (R;US)

Metcalf and Eddy, Inc., Wakefield, MA (United States)
Four Mile Creek semi-annual sampling report, January 1993 sampling event, 18:33842 (R;US)

Michigan Biotechnology Inst., Lansing, MI (United States)
Bioconversion of coal-derived synthesis gas to liquid fuels: Quarterly technical progress report, April 1, 1993–June 30, 1993, 18:32678 (R;US)

Michigan State Univ., East Lansing, MI (United States)
The RDT-RPC technology option of GEM, 18:33652 (R;US)

Michigan Univ., Ann Arbor, MI (United States)
A free energy simulation method based study of interfacial segregation: Annual progress report, FY 1992, 18:33157 (R;US)

Michigan Univ., Ann Arbor, MI (United States). Dept. of Atmospheric and Oceanic Science
Role of x-ray-induced transcripts in adaptive responses following x-rays: Progress report, Year 2, 18:33914 (R;US)

Michigan Univ., Ann Arbor, MI (United States). Dept. of Chemical Engineering
A novel, integrated treatment system for coal waste waters: Quarterly report, March 2, 1993–June 1, 1993, 18:32201 (R;US)

Minnesota Univ., Minneapolis, MN (United States). Dept. of Mechanical Engineering
Substrate temperature measurement and control during thermal plasma CVD, 18:33253 (R;US)

Minnesota Univ., Minneapolis, MN (United States). Mineral Resources Research Center
Molten iron oxysulfide as a superior sulfur sorbent: First and second quarters progress report, September 1, 1989–March 1, 1990, 18:32761 (R;US)

Minnesota Univ., St. Paul, MN (United States). Inst. of Technology
Molten iron oxysulfide as a superior sulfur sorbent: Technical progress report, December 1, 1991–February 29, 1992, 18:32230 (R;US)
Molten iron oxysulfide as a superior sulfur sorbent: Technical progress report, June 1–August 31, 1992, 18:32231 (R;US)

Mission Research Corp., San Diego, CA (United States)
Evaluation of using cyclocranes to support drilling and production of oil and gas in wetland areas: Fourth quarterly technical progress report, Second quarter, 1993, 18:32309 (R;US)

Mississippi State Univ., MS (United States)
Travel to France for presentation of paper on MHD coal combustor: Foreign trip report, September 28–October 6, 1991, 18:33050 (R;US)

Mitre Corp., McLean, VA (United States). METREK Div.
Evaluation of dense-phase ultrafine coal (DUC) as a fuel alternative for oil- and gas-designed boilers and heaters: Final report, 18:32753 (R;US)

MK-Ferguson of Oak Ridge Co., TN (United States)
Interim remedial action work plan for the cesium plots at Waste Area Grouping 13 at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 18:32547 (R;US)

Moerk Thomsen (J.), Smoerum (Denmark)
The thermodynamic solar heating system TE-DY: Preliminary project, 18:32712 (I;DK;In Danish)

Morgan State Univ., Baltimore, MD (United States). School of Engineering
Armed forces career exploration for high school students in the fields of engineering and science: Final report, 18:33119 (R;US)

Mount Holyoke Coll., South Hadley, MA (United States)
Nuclear transparency and double beta decay of molybdenum 100: Annual progress report, February 1, 1993–January 31, 1994, 18:34154 (R;US)

MPR Associates, Inc., Washington, DC (United States)
Reactor safety issues resolved by the 2D/3D Program: International Agreement Report, 18:32939 (R;US)

MSE, Inc., Butte, MT (United States)
Projects at the Component Development and Integration Facility: Quarterly technical progress report, January 1–March 31, 1993, 18:32546 (R;US)

N

National Academy of Sciences - National Research Council, Washington, DC (United States)
The Geotechnical Board National Research Council: [Annual] activities report, March 1, 1991–June 30, 1992, 18:32209 (R;US)
[Geotechnical Board activities and funding]: [Annual] activites report, July 1, 1992–June 30, 1993, 18:33973 (R;US)

National Conference of States on Building Codes and Standards, Inc., Herndon, VA (United States)
Evaluation and demonstration of decentralized space and water heating versus centralized services for new and rehabilitated multifamily buildings: Final report, 18:33046 (R;US)

National Energy Information Center, Washington, DC (United States)
EIA publications directory, 1992, 18:33005 (R;US)

National Inst. for Fusion Science, Nagoya (Japan)
A compact neutron counter telescope with thick radiator (COTETRA) for fusion experiment, 18:34512 (R;JP)

National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States)
Annotated bibliography of selected references on shoreline barrier island deposits with emphasis on Patrick Draw Field, Sweetwater County, Wyoming, 18:32254 (R;US)
Estimates of future regional heavy oil production at three production rates–background information for assessing effects in the US refining industry, 18:32302 (R;US)
Field application of foams for oil production symposium: Proceedings, 18:32275 (R;US)
Microbial enhanced waterflooding Mink Unit and Phoenix field pilots: Final report, 18:32276 (R;US)
National Institute for Petroleum and Energy Research quarterly technical report for January 1–March 31, 1993: Volume 1, Fuels research, 18:32312 (R;US)
National Institute for Petroleum and Energy Research quarterly technical report for April 1–June 30, 1993: Volume 1, Fuels research, 18:32313 (R;US)
[National Institute for Petroleum and Energy Research] monthly progress report for July 1993, 18:32277 (R;US)

National Inst. of Standards and Technology, Gaithersburg, MD (United States)
Electron transport calculations with biomedical and environmental applications, 18:33913 (R;US)

National Inst. of Standards and Technology, Gaithersburg, MD (United States). Thermophysics Div.
Thermophysical properties: Progress report, 1 January 1992–31 March 1993, 18:33252 (R;US)

National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)
Accelerator shielding benchmark problems, 18:33597 (R;JP)
Hydrogen depth profile of Al-alloy vacuum chamber exposed to synchrotron radiation, 18:33600 (RA;JP)
JLC-I, 18:33478 (R;JP)
KENS report - 9, 1991/92, 18:33599 (R;JP)
PLS vacuum chamber, 18:33641 (RA;JP)
Proceedings of the meeting on engineering and technology in basic research, 18:33456 (R;JP;In Japanese)
Proceedings of the second EGS4 user's meeting in Japan, 18:34660 (R;JP;In Japanese)
Proceedings of the third workshop on Japan linear collider (JLC), 18:33479 (R;JP)
Study on interstrand coupling losses in Rutherford-type superconducting cables, 18:33598 (R;JP)
The proceedings of the KEK FEL simulation code workshop, 18:33506 (R;JP;In Japanese)
The TRISTAN light source project, 18:33642 (RA;JP)
The tristan super light facility: Conceptual design report 1992, 18:33640 (R;JP)

National Renewable Energy Lab., Golden, CO (United States)
A rugged, low-cost advanced data acquisition system for field test projects, 18:32745 (R;US)
Building integrated photovoltaic systems analysis: Preliminary report, 18:32695 (R;US)
Data collection plan for Phase 2 Alternative Fuels Bus Data Collection Program: Final report, 18:33101 (R;US)
Evaluation of aftermarket LPG conversion kits in light-duty vehicle applications: Final report, 18:33126 (R;US)
Expansion of the Joint US-Brazilian PV Rural Electrification Pilot Project: Foreign trip report, May 23–30, 1993, 18:32694 (R;US)
Gallium arsenide-based ternary compounds and multi-band-gap solar cell research: Final subcontract report, 1 April 1988–31 March 1990, 18:32686 (R;US)
IEA Solar Heating and Cooling Program Task 12, building energy analysis and design tools for solar applications and advanced analysis tools workshop in Denmark: Foreign trip report, March 8–14, 1992, 18:32705 (R;US)
International symposium and exhibition of experimental technologies: Foreign trip report, May 29–June 6, 1992, 18:32996 (R;US)
Polycrystalline thin-film cadmium telluride solar cells fabricated by electrodeposition: Annual subcontract report, 20 March 1992–19 March 1993, 18:32688 (R;US)
Research on defects and transport in amorphous-silicon-based semiconductors: Annual subcontract report, 20 February 1992–19 February 1993, 18:32687 (R;US)

Research on stable, high-efficiency amorphous silicon multijunction modules: Annual subcontract report, 1 January 1992–28 February 1993, 18:32685 (R;US)
The international operation workshop for the tropical oceans-global atmosphere coupled ocean-atmosphere response experiment in Australia: Foreign trip report, March 6–17, 1993, 18:33758 (R;US)
Travel to Denmark and Switzerland concerning safety codes at wind turbine test facilities: Foreign trip report, April 27–May 5, 1993, 18:32738 (R;US)
Travel to Finland for the International Energy Agency Symposium on Biotechnology for the Conversion of Lignocellulose: Foreign trip report, June 7–9, 1993, 18:32641 (R;US)
Travel to India to present paper on $CuInSe_2$ type materials at solar cell materials conference: Foreign trip report, February 5–24, 1992, 18:32683 (R;US)
Travel to Italy for meetings on Solar Photovoltaics Energy Systems: Foreign trip report, May 2–7, 1993, 18:32693 (R;US)
Travel to Italy to participate in the International Electrotechnical Committee TC-88 Working Group 6 Performance Standards Meeting: Foreign trip report, May 23–May 27, 1993, 18:32739 (R;US)
Travel to Italy to plan agenda of International Electrotechnical Commission/Technical Committee 82, Solar Photovoltaic Energy Systems meeting: Foreign trip report, May 2–8, 1993, 18:34631 (R;US)
Travel to Japan and India to discuss photovoltaic program strategies and funding: Foreign trip report, February 3–16, 1992, 18:32682 (R;US)
Travel to Japan to participate in meeting on Advanced Solar Low-Energy Buildings: Foreign trip report, September 4–12, 1992, 18:33086 (R;US)
Travel to Mexico and Guatemala to discuss renewable energy programs and projects: Foreign trip report, May 18–30, 1993, 18:33048 (R;US)
Travel to Papua New Guinea to apprise weather officials of planned activities of the Pilot Radiation Observation Experiment (PROBE): Foreign trip report, May 1–10, 1992, 18:33762 (R;US)
Travel to Papua New Guinea to shut down the Pilot Radiation Observation Experiment (PROBE): Foreign trip report, May 7–19, 1993, 18:33760 (R;US)
Travel to Scotland to review IEA Task VII on methods for conversion of biomass feedstocks and plan new Tasks XI on converting municipal solid waste to energy: Foreign trip report, March 31–April 9, 1992, 18:33113 (R;US)
Travel to United Kingdom and Sweden to attend meeting concerning the development of wind energy systems: Foreign trip report, May 2–9, 1993, 18:32734 (R;US)

Netherlands Energy Research Foundation (ECN), Petten (Netherlands)
Assessment of RELAP5/MOD2 against a natural circulation experiment in Nuclear Power Plant Borssele: International Agreement Report, 18:32936 (R;US)
Assessment of RELAP5/MOD2 against ECN-reflood experiments: International Agreement Report, 18:32938 (R;US)
CO_2 abatement in the Netherlands: A study following UNEP guidelines, 18:32999 (R;NL)
Comparison of wind turbine structural design according to Dutch standard and draft IEC TC88 standard, 18:32744 (R;NL)
Experiences with the application of different energy models in East European countries, 18:32980 (R;NL)
Flame transformations and burner slagging in a 2.5 MW furnace firing pulverized coal: Part 1: Flame transformations, 18:32241 (R;NL)
Flame transformations and burner slagging in a 2.5 MW furnace firing pulverized coal: Part 2: Slagging, 18:32242 (R;NL)
Molecular dynamics simulation of binary mixtures of molten alkali carbonates, 18:33059 (R;NL)
PHATAS-2: Program for Horizontal Axis wind Turbine Analysis and Simulation Version 2, 18:32743 (R;NL)
Profile calculations with the airfoil design code XFOIL, 18:32741 (R;NL;In Dutch)
Reliability analysis for the load-carrying parts of horizontal axis wind turbines, 18:32742 (R;NL)
Status of PHATAS-2 release 'Jul-93', 18:32740 (R;NL)
Storage restrictions and the preference for CO_2 removal options, 18:33806 (R;NL)
Task Force on Integrated Energy and Environmental Planning: The Netherlands - Poland: Volume 4: Verification and extension of the Polish energy and environmental data base, 18:32978 (R;NL)
Task Force on Integrated Energy and Environmental Planning: The Netherlands - Poland: Volume 2: Integrated economy-energy-environment policy in Poland: A computable general equilibrium modelling approach, 18:32979 (R;NL)
Task Force on Integrated Energy and Environmental Planning: The Netherlands - Poland: Working Paper 2: Government institutions of the energy sector in the EC countries, 18:33030 (R;NL)
Task Force on Integrated Energy and Environmental Planning: The Netherlands - Poland: Working Paper 1: Description of the former and current energy administration of Poland, 18:33009 (R;NL)

Nevada Nuclear Waste Project Office, Carson City, NV (United States)
Neotectonics of the southern Amargosa Desert, Nye County, Nevada and Inyo County, California, 18:32461 (R;US)

Nevada Univ., Las Vegas, NV (United States)
DOE Waste Package Project: Quarterly progress report, April 1, 1993–June 30, 1993 and end of year summary report, 18:32380 (R;US)
Nevada's energy research strategy: Progress report, September 30, 1991–September 29, 1992, 18:33007 (R;US)
Studies of clusters: Fourth quarterly technical progress report, April 1, 1993–June 30, 1993, 18:34447 (R;US)

Nevada Univ., Reno, NV (United States)
Neotectonics of the southern Amargosa Desert, Nye County, Nevada and Inyo County, California, 18:32461 (R;US)

New Energy and Industrial Technology Development Organization, Tokyo (Japan)
Feasibility survey of thermoelectric conversion technology using semiconductors, 18:33056 (R;JP;In Japanese)
Field survey of information collected Pacific energy policies.: Rural electrification and photovoltaic generation in Sarawak, 18:33028 (R;JP;In Japanese)
Report of analytical survey of Pacific energy information, 18:33029 (R;JP;In Japanese)
Research on possibility of utilization of palm methylester for diesel engines, 18:32673 (R;JP;In Japanese)
Survey of actual status of energy consumption in the residential sector, 18:33045 (R;JP;In Japanese)

New Mexico Highlands Univ., Las Vegas, NM (United States)
Science and Technology Alliance work schedule FY 1992: Annual report, 18:34628 (R;US)

New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Dept. of Chemistry
Organic carbonyl compounds in Albuquerque, New Mexico, air: A preliminary study of the effects of oxygenated fuel use, 18:33751 (R;US)

New Mexico Inst. of Mining and Technology, Socorro, NM (United States). New Mexico Petroleum Recovery Research Center
Field verification of CO_2-foam: [Quarterly] report, July 1–September 30, 1992, 18:32272 (R;US)

New Mexico State Univ., Las Cruces, NM (United States). Southwest Technology Development Inst.
Effects of the Mount Pinatubo eruption on solar insolation: Four case studies, 18:33784 (R;US)
Tehachapi solar thermal system first annual report, 18:32698 (R;US)

New Mexico Univ., Albuquerque, NM (United States)
Colloid transport code-nuclear user's manual, 18:32415 (R;US)
Pilot Project on Women and Science: A report on women scientists at the University of New Mexico and Los Alamos National Laboratory, 18:32986 (R;US)

New Mexico Univ., Albuquerque, NM (United States). Center for Micro-Engineered Ceramics
Advanced NMR-based techniques for pore structure analysis of coal: Quarterly report No. 7, April 1, 1993–June 31, 1993, 18:32191 (R;US)

New Mexico Univ., Albuquerque, NM (United States). Dept. of Chemical and Nuclear Engineering
Computational support and model development for edge-plasma and energy transport simulations: Progress report, 1989, 18:34609 (R;US)
Probability computations using the SIGMA-PI method on a personal computer, 18:34661 (R;US)
Shrinkage void formation and its effect on freeze and thaw processes of lithium and lithium-fluoride for space applications: [Final report], 18:32786 (R;US)

New Mexico Univ., Albuquerque, NM (United States). Dept. of Computer Science
Message passing in PUMA, 18:34677 (R;US)

New Mexico Univ., Albuquerque, NM (United States). Dept. of Geology
Geochemical study of evaporite and clay mineral-oxyhydroxide samples from the Waste Isolation Pilot Plant site, 18:32469 (R;US)

New South Wales Univ., Kensington, NSW (Australia). Centre for Photovoltaic Devices and Systems
Silicon concentrator solar cell research, 18:32690 (R;US)

New York State Dept. of Environmental Conservation, Albany, NY (United States). Automotive Emissions Lab.
Methanol fuel vehicle demonstration: Exhaust emission testing: Final report, 18:33127 (R;US)

New York State Energy Research and Development Authority, Albany, NY (United States)
Analysis of fuel savings associated with fuel computers in multifamily buildings: Final report, 18:33091 (R;US)
Evaluation and demonstration of decentralized space and water heating versus centralized services for new and rehabilitated multifamily buildings: Final report, 18:33046 (R;US)
Methanol fuel vehicle demonstration: Exhaust emission testing: Final report, 18:33127 (R;US)
New York State Low-Level Radioactive Waste Status Report for 1992, 18:32462 (R;US)

Nordisk Gasteknisk Center, Hoersholm (Denmark)
Reburning rich-lean kinetics: Annual report 1992, 18:33775 (R;DK)

Nordisk Kernesikkerhedsforskning, Roskilde (Denmark)
The Nordic programme for nuclear safety 1990-1993. Report for 1992, 18:32923 (R;DK;In Danish, English, Norwegian, Swed)
The Nordic programme for nuclear safety 1990-1993. Plan for 1993, 18:32924 (R;DK;In Danish, Swedish, Norwegian, Engl)

Norges Allmennvitenskapelige Forskningraad, Oslo (Norway)
Evaluation of the RAIN project: Reversing acidification in Norway, 18:33000 (R;NO)

Norges Landbrukshoegskole, Aas (Norway)
Solar collectors for pre-heating of air for drying grain and hay in Norway, 18:32713 (R;NO)

Norsk Polarinstitutt, Oslo (Norway)
Atmospheric CO_2 and global warming: A critical review, 18:33776 (R;NO)

North Carolina Univ., Charlotte, NC (United States). Dept. of Chemistry
Oligomer and mixed-metal compounds, potential multielectron transfer catalysts: Progress report, January 1, 1990–January 1, 1993, 18:33320 (R;US)

North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center
Determinations of ash formation and deposition mechanisms at Minnesota Power Clay Boswell Station, 18:32221 (R;US)

Northeastern Univ., Boston, MA (United States)
Control of coal combustion SO_2 and NO_x emissions by in-boiler injection of CMA: Second quarterly project status report, 1 April 1993–30 June 1993, 18:32204 (R;US)

Northeastern Univ., Boston, MA (United States). Dept. of Mechanical Engineering
Combustion behavior of single coal-water slurry droplets, Part 1: Experimental techniques, 18:32210 (R;US)
Combustion of single CWF droplets of either pulverized or micronized coal, 18:32211 (R;US)

Northern Illinois Univ., De Kalb, IL (United States)
Studies of high energy phenomena using muons: Final progress report, 18:34039 (R;US)

Northwestern Univ., Evanston, IL (United States)
Research in high energy physics: Progress report, July 1, 1992–June 30, 1993, 18:34016 (R;US)
The effects of moisture on the microstructure of cement-based materials: Progress report, 18:33255 (R;US)

Northwestern Univ., Evanston, IL (United States). Dept. of Chemistry
Vibrational dynamics in photoinduced electron transfer: Progress report, December 1, 1992–November 30, 1993, 18:33338 (R;US)

Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan)
Chickpea improvement: performance of chickpea mutants in micro yield trials at NIFA, 18:33905 (R;PK)
Electrophoretic studies on rape seed proteins, 18:33907 (R;PK)
Irradiation processing of potatoes, onions and garlic, 18:33908 (R;PK)
Oilseed brassica improvement through induced mutations, 18:33906 (R;PK)
Radiation decontamination of frozen chicks, 18:33902 (R;PK)
Radiation decontamination of spices, 18:33904 (R;PK)
Radiosensitivity of red flour beetle tribolium castaneum, 18:33903 (R;PK)

Nuclear Regulatory Commission, Washington, DC (United States)
Reactor safety issues resolved by the 2D/3D Program: International Agreement Report, 18:32939 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering
Aging assessment of nuclear air-treatment system HEPA filters and adsorbers: Volume 1, Phase 1, 18:32809 (R;US)
Auxiliary feedwater system aging study: Volume 2, Phase 1: Follow-on study, 18:32808 (R;US)
Generic analyses for evaluation of low Charpy upper-shelf energy effects on safety margins against fracture of reactor pressure vessel materials, 18:32929 (R;US)
Long-term embrittlement of cast duplex stainless steels in LWR systems: Semiannual report, April–September 1992: Volume 7, No. 2, 18:32807 (R;US)
Methodology for reliability based condition assessment: Application to concrete structures in nuclear plants, 18:32931 (R;US)
Piping benchmark problems for the General Electric Advanced Boiling Water Reactor, 18:32930 (R;US)
Risk-based inspection–Development of guidelines: Volume 2, part 1, light water reactor (LWR) nuclear power plant components, 18:32771 (R;US)
Seismological investigation of earthquakes in the New Madrid Seismic Zone: Final report, September 1986–December 1992, 18:32932 (R;US)
Virginia Regional Seismic Network: Final report (1986–1992), 18:32822 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services
Indexes to Nuclear Regulatory Commission issuances, July–December 1992: Volume 36, Index 2, 18:32790 (R;US)
Indexes to Nuclear Regulatory Commission issuances, January–March 1993: Volume 37, Index 1, 18:32791 (R;US)
NRC regulatory agenda: Quarterly report, April–June 1993: Volume 12, No. 2, 18:32793 (R;US)

The evolution of the PVM concurrent computing system, 18:34645 (R;US)
The Fourier analysis technique and epsilon-pseudo-eigenvalues, 18:34669 (R;US)
The influence of specimen size on measurement of thermal or irradiation creep in pressurized tubes, 18:34538 (RA;US)
The influence of transmutation and void swelling on the electrical properties of copper and several copper alloys, 18:34570 (RA;US)
The Oak Ridge National Laboratory automobile heat pump model: User's guide, 18:33102 (R;US)
The relationship between the collisional phase defect distribution and cascade collapse efficiency, 18:34544 (RA;US)
The source term and waste optimization of molten salt reactors with processing, 18:32818 (R;US)
The technical viability of alternative blowing agents in polyisocyanurate roof insulation: A cooperative industry/government project, 18:33092 (R;US)
The urban perspectives of acid rain: Workshop summary, 18:33778 (R;US)
The use of large surface area for particle and power deposition, 18:34529 (R;US)
Thermal energy storage technical progress report, April 1992–March 1993, 18:32968 (R;US)
Thermophysical properties of saturated light and heavy water for Advanced Neutron Source applications, 18:33334 (R;US)
Three immobilized-cell columnar bioreactors for enhanced production of commodity chemicals, 18:32674 (R;US)
Transmutation of copper in FFTF and starfire, 18:34542 (RA;US)
Travel to Austria to attend meeting on effects of atomic radiation: Foreign trip report, May 22–29, 1993, 18:33949 (R;US)
Travel to Austria to participate in the quality control programs for uranium and plutonium measurements under ISPO Task D.66 for the Safeguards Analytical Laboratory: Foreign trip report, April 23–May 14, 1993, 18:32601 (R;US)
Travel to Austria to participate in the International Atomic Energy Agency's Consultants Services Meeting on Low Specific Activity Materials and for the revision of the IAEA Regulations for the Safe Transport of Radioactive Material: Foreign trip report, May 3–22, 1993, 18:32345 (R;US)
Travel to Austria to participate in meeting for revision of IAEA regulations for safe transport of radioactive material: Foreign trip report, May 15–22, 1993, 18:32346 (R;US)
Travel to Denmark and Sweden to attend the conference on Perspectives in Nuclear Structure: Foreign trip report, June 11–23, 1993, 18:34152 (R;US)
Travel to England for conference on nuclear transport systems: Foreign trip report, June 7–10, 1993, 18:32347 (R;US)
Travel to England for meetings on international standards for information technology: Foreign trip report, April 28–May 18, 1993, 18:34703 (R;US)

Travel to England to participate in the EUROGAM collaboration meeting held on the campus of the University of Liverpool: Foreign trip report, May 14–20, 1993, 18:33681 (R;US)
Travel to France to attend seminar on advanced Monte Carlo Computer Program for Radiation Transport: Foreign trip report, April 25–May 2, 1993, 18:34427 (R;US)
Travel to France to chair meeting of the Criticality Calculations Working Group: Foreign trip report, June 17–19, 1992, 18:33378 (R;US)
Travel to France to obtain operating experience with the CAPRICE ECR ion source: Foreign trip report, February 14–26, 1992, 18:33614 (R;US)
Travel to France to participate in seminar on Advanced Monte Carlo Programs for Radiation Transport: Foreign trip report, April 24–May 1, 1993, 18:34428 (R;US)
Travel to France to participate in an x-ray microprobe experiment at the European Synchrotron Radiation Facility and to discuss developments in x-ray optics and beamline control programs: Foreign trip report, May 19–26, 1993, 18:34469 (R;US)
Travel to Germany for planning of the fracture analysis of large-scale international reference experiments (FALSIRE) project: Foreign trip report, May 28–June 11, 1993, 18:33191 (R;US)
Travel to Germany to review testing of high-temperature gas-cooled reactor fuels and attend Fuels, Fission Products and Graphite Program meeting: Foreign trip report, May 30–June 6, 1992, 18:32777 (R;US)
Travel to Great Britain and Germany concerning radiation dosimetry research: Foreign trip report, July 7–August 10, 1992, 18:33948 (R;US)
Travel to Italy for conference on Fusion Reactor Materials: Foreign trip report, April 26–May 2, 1993, 18:34616 (R;US)
Travel to Italy to attend the Fifteenth International Symposium on Capillary Chromatography: Foreign trip report, May 22, 1993–May 30, 1993, 18:33306 (R;US)
Travel to Japan and China to address engineering issues related to the design of the barium fluoride calorimeter for the second detector at the Superconducting Super Collider Laboratory: Foreign trip report, May 24–June 2, 1991, 18:33680 (R;US)
Travel to Japan for the Third International Conference on Materials and Mechanisms of High-Temperature Superconductivity: Foreign trip report, July 19–31, 1991, 18:33234 (R;US)
Travel to Japan to observe state of the art robotics in the apparel industry: Foreign trip report, May 7–15, 1993, 18:33379 (R;US)
Travel to Mexico to assist in the planning and development of R&D Magazine: Foreign trip report, April 29–May 3, 1993, 18:33013 (R;US)
Travel to Norway to present a paper at the 8th Scandanavian Conference on Image Analysis: Foreign trip report, May 23–31, 1993, 18:33380 (R;US)
Travel to ORNL for meeting on Protection Against Environmental Mutagens and Carcinogens (ICPEMC): Foreign trip report, May 9–23, 1993, 18:33964 (R;US)
Travel to United Kingdom for meeting on the evaluation of steel components: Foreign trip report, April 24–28, 1993, 18:33190 (R;US)
Travel to York, UK to participate in the 28th Colloquium Spectroscopicum Internationale: Foreign trip report, June 26–July 5, 1993, 18:33307 (R;US)
Tritium modeling/BEATRIX-II data analysis, 18:34577 (RA;US)
Tritium release from ceramic breeder materials, 18:34576 (RA;US)
Tritium transport in single crystal $LiAlO_2$, 18:34579 (RA;US)
Uranium effluent testing for the Oak Ridge Toxic Substances Control Act mixed waste incinerator, 18:32360 (R;US)
US participation at the Fourth Coordination Research Program (CRP) meeting on validation of safety related physics calculations for low-enriched gas-cooled reactors: Foreign trip report, April 23–29, 1993, 18:32778 (R;US)
Waste treatment for removed protective coatings, 18:33104 (R;US)
Workshop on innovation in materials processing and manufacture: Exploratory concepts for energy applications, 18:33141 (R;US)
X-231B technology demonstration for in situ treatment of contaminated soil: Laboratory evaluation of in situ vapor stripping, 18:33822 (R;US)

Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center
CDIAC catalog of numeric data packages and computer model packages, 18:34702 (R;US)

Oak Ridge Y-12 Plant, TN (United States)
A shear reversal nozzle for efficient gas atomization, 18:33406 (R;US)
Rapid determination of uranium in natural waters by thermal emission mass spectrometry: Revision 1, 18:33854 (R;US)
Remedial investigation work plan for Bear Creek Valley Operable Unit 2 (Rust Spoil Area, SY-200 Yard, Spoil Area 1) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Environmental Restoration Program, 18:32550 (R;US)
Validation of criticality safety calculational methods for U-AVLIS plant project, 18:32335 (R;US)

Ogden Environmental and Energy Services Co., Inc., Blue Bell, PA (United States)
Aging Management Guideline for commercial nuclear power plants: Electrical switchgear: Final report, 18:32811 (R;US)

Ohio Coal Development Office, Columbus, OH (United States)
Demonstration of an advanced circulation fludized bed coal combustor phase 1: Cold model study: Final report, 18:32244 (R;US)
Ultrafine calcium aerosol: Generation and use as a sorbent for sulfur in coal combustion: Volume 1, Experimental work: Final report, August 1, 1988–October 31, 1991, 18:32767 (R;US)
Ultrafine calcium aerosol: Generation and use of a sorbent for sulfur in coal combustion: Volume 2, Economics: Final report, August 1, 1988–October 31, 1991, 18:32768 (R;US)

Ohio Coal Research Center, Athens, OH (United States)
Ultrafine calcium aerosol: Generation and use as a sorbent for sulfur in coal combustion: Volume 1, Experimental work: Final report, August 1, 1988–October 31, 1991, 18:32767 (R;US)
Ultrafine calcium aerosol: Generation and use of a sorbent for sulfur in coal combustion: Volume 2, Economics: Final report, August 1, 1988–October 31, 1991, 18:32768 (R;US)

Manufacturing technology, 18:33112 (R;US)
Meetings in Germany concerning TEXTOR and ITER: Foreign trip report, February 22–March 3, 1993, 18:34593 (R;US)
MELCOR 1.8.1 calculations of ISP31: The CORA-13 experiment, 18:32945 (R;US)
Message passing in PUMA, 18:34677 (R;US)
Metallurgical evaluation of SRAM II/SRAM A programmer base plates, 18:33197 (R;US)
MIMD massively parallel methods for engineering and science problems, 18:33986 (R;US)
Mineral hydrolysis kinetics, 18:33336 (R;US)
Motorola MC68040 high-speed design using Altera EPM5000 Erasable programmable logic devices, 18:33446 (R;US)
Networked MS Windows 3.1 based Classified Document Control System (CDOCS), 18:34705 (R;US)
New applications for high average power beams, 18:33015 (R;US)
Nuclear weapon reliability evaluation methodology, 18:33737 (R;US)
Numerical solutions for a flow with mixed convection in a vertical geometry, 18:33420 (R;US)
Object-oriented DFD models to present the functional and behavioral views, 18:34679 (R;US)
Operations manual for the Beneficial Uses Shipping System cask: Revision 1, 18:33389 (R;US)
Optimization of the Spent Fuel Attribute Tester using radiation transport calculations, 18:32349 (R;US)
Optimizing wind turbine control system parameters, 18:32747 (R;US)
Participation in the NATO/AGARD symposium on theoretical and experimental methods in hypersonic flows in Turino, Italy: Foreign trip report, May 2–17, 1992, 18:33356 (R;US)
Perforation of HY-100 steel plates with long rod projectiles, 18:33709 (R;US)
Photo-induced and electrooptic properties of $(Pb,La)(Zr,Ti)O_3$ films, 18:33280 (R;US)
Photovoltaic concentrator initiative: Concentrator cell development, 18:32689 (R;US)
Physical protection design approach for the Complex 21/Reconfiguration facilities, 18:32611 (R;US)
Preclosure radiological safety evaluation: Exploratory Studies Facility: Yucca Mountain Site Characterization Project, 18:32476 (R;US)
Preliminary performance assessment of the Greater Confinement Disposal facility at the Nevada Test Site: Volume 3: Supporting details, 18:32473 (R;US)
Preliminary study of discharge characteristics of slim holes compared to production wells in liquid-dominated geothermal reservoirs, 18:32725 (R;US)
Pretreatment of coal and recycle oil for direct liquefaction, 18:32182 (R;US)
Procedures for measuring the properties of heat-pipe wick materials, 18:32697 (R;US)
Processes, mechanisms, parameters, and modeling approaches for partially saturated flow in soil and rock media: Yucca Mountain Site Characterization Project, 18:32471 (R;US)
Properties of salt-saturated concrete and grout after six years in situ at the Waste Isolation Pilot Plant, 18:32486 (R;US)
Python fiber optic seal, 18:32610 (R;US)
Radiological consequences of radioactivity release from spallation targets, 18:33484 (R;US)
Reconsolidation of salt as applied to permanent seals for the Waste Isolation Pilot Plant, 18:32484 (R;US)
Reducing inadvertent alloying of metal/ceramic brazes, 18:33142 (R;US)
Remediating hazardous waste robotically using a high-level control system and real-time sensors, 18:32577 (R;US)
Review of radionuclide source terms used for performance-assessment analyses: Yucca Mountain Site Characterization Project, 18:32477 (R;US)
Rock mass mechanical property estimations for the Yucca Mountain Site Characterization Project: Yucca Mountain Site Characterization Project, 18:32474 (R;US)
Role of pressure in the study of fullerenes, 18:33281 (R;US)
Room closure response to gas generation and mechanical strength of different waste forms in a bedded salt repository, 18:32483 (R;US)
Sample Vial Secure Container, 18:32612 (R;US)
Sandia equation of state data base: seslan File, 18:33198 (R;US)
Sandia technology engineering and science accomplishments, 18:33014 (R;US)
Seal design alternatives study, 18:32480 (R;US)
Secure authenticated video equipment, 18:33137 (R;US)
Shock compression properties of silicon carbide, 18:33238 (R;US)
Silicon concentrator solar cell research, 18:32690 (R;US)
Silicon MCM substrates for integration of III-V photonic devices and CMOS IC's, 18:33447 (R;US)
Six degree of freedom fine motion positioning stage based on magnetic levitation, 18:33445 (R;US)
Solderability perservative coatings: Electroless tin vs. organic azoles, 18:33443 (R;US)
Some parametric flow analyses of a particle bed fuel element, 18:32787 (R;US)
Stockpile Transition Enabling Program (STEP): Process and project requirements, 18:33131 (R;US)
Stress pulse phenomena, 18:33282 (R;US)
Target response to debris cloud incidence, 18:33427 (R;US)
Tehachapi solar thermal system first annual report, 18:32698 (R;US)
Testing and evaluation of large-area heliostats for solar thermal applications, 18:32717 (R;US)

The advantages of a salt/bentonite backfill for Waste Isolation Pilot Plant disposal rooms, 18:32472 (R;US)
The Authenticated Tracking and Monitoring System (ATMS) concept, 18:33138 (R;US)
The CAESAR project: Experimental and modeling investigations of methane reforming in a CAtalytically Enhanced Solar Absorption Receiver on a parabolic dish, 18:32715 (R;US)
The calculation and application of quantitative risk goals for nuclear facilities, 18:32944 (R;US)
The continuing challenge of electromagnetic launch, 18:33392 (R;US)
The effects of initial conditions and control time on optimal actuator placement via a max-min Genetic Algorithm, 18:33398 (R;US)
The Lever oscillator for use in high resistance resonator applications, 18:33440 (R;US)
The minimum detection limits of RDX and TNT deposited on various surfaces as determined by ion mobility spectroscopy, 18:33315 (R;US)
The potential of intelligent vehicle highway systems for enhanced traveler security, 18:33103 (R;US)
The unique signal concept for detonation safety in nuclear weapons, 18:33736 (R;US)
Thermal imaging systems for Air Force security applications, 18:32606 (R;US)
Thermal test options, 18:33393 (R;US)
Travel to Austria to participate in safeguards topic meeting on the Integrated Surveillance Package: Foreign trip report, November 17–22, 1991, 18:33133 (R;US)
Travel to England for exchange of information on direct coal liquefaction: Foreign trip report, December 9–16, 1992, 18:32156 (R;US)
Travel to England for Workshop on Two-Phase Flow Fundamentals: Foreign trip report, June 11–30, 1992, 18:33409 (R;US)
Travel to Europe for research in INTRAVAL; modelling brine inflow and groundwater flow at WIPP: Foreign trip report, March 27–April 3, 1993, 18:33801 (R;US)
Travel to Europe to evaluate electrokinetic technology applications to remedial treatment of metal contaminated soils and groundwater: Foreign trip report, December 11–18, 1991, 18:32544 (R;US)
Travel to France regarding research on photoconductive semiconductor switches, optoelectronics, and low impedance anode plasma source drivers: Foreign trip report, May 6–21, 1993, 18:33706 (R;US)
Travel to France to report on Waste Management projects at WIPP and Yucca Mountain: Foreign trip report, February 2–8, 1992, 18:32366 (R;US)
Travel to Germany and Austria regarding heavy ion fusion and radiation transport: Foreign trip report, January 28–February 15, 1992, 18:34594 (R;US)
Travel to Germany for meeting on important future issues facing the NATO alliance: Foreign trip report, March 5–10, 1992, 18:33705 (R;US)
Travel to Germany to attend First European Space Debris Conference: Foreign trip report, March 27–April 10, 1993, 18:33355 (R;US)
Travel to Germany to attend meeting on lithium batteries: Foreign trip report, May 9–21, 1992, 18:32970 (R;US)
Travel to India to attend and present an invited lecture at the 8th annual meeting of the Polymer Processing Society: Foreign trip report, March 21–April 8, 1992, 18:33257 (R;US)
Travel to Italy to attend conference on small-angle x-ray and neutron scattering: Foreign trip report, May 9–20, 1993, 18:34417 (R;US)
Travel to Japan for conference on high pressure in semiconductor physics: Foreign trip report, August 13–24, 1992, 18:33256 (R;US)
Travel to Japan to collaborate with the JT-60U diverter physics group on the tokamak experiment: Foreign trip report, March 17–April 3, 1993, 18:34595 (R;US)
Travel to Paris, France for the third meeting of the NEA Coordinating Group on site evaluation and design of experiments for radioactive waste disposal (SEDE): Foreign trip report, January 28–31, 1992, 18:32368 (R;US)
Travel to Russia for discussions on potential on non-weapon nuclear collaborations: Foreign trip report, May 26–June 2, 1992, 18:33008 (R;US)
Travel to Sweden to present talk on the electronic structure of alkali metal-nickel group hydrogen compounds: Foreign trip report, June 6–July 10, 1992, 18:32634 (R;US)
Travel to the UK to attend the third international conference on dense z pinches and to discuss new soft x-ray test capabilities at the Atomic Weapons Establishment: Foreign trip report, April 17–24, 1993, 18:33730 (R;US)
Travel to the United Kingdom to attend and participate in Nuclear Energy Agency Probabilistic System Assessment Group's Level 2 Exercise Task Group meeting: Foreign trip report, May 3–10, 1992, 18:32373 (R;US)
Travel to United Kingdom to attend the 12th Aerodynamic Decelerator Systems Technology (ADST) conference, seminar, and post-conference technical tour: Foreign trip report, May 5–22, 1993, 18:33357 (R;US)
Understanding requirements via natural language information modeling, 18:34706 (R;US)
Use of a commercial heat transfer code to predict horizontally oriented spent fuel rod surface temperatures, 18:33394 (R;US)
Use of slim holes for geothermal exploration and reservoir assessment: A preliminary report on Japanese experience, 18:32726 (R;US)
Use of the iterative solution method for coupled finite element and boundary element modeling: Yucca Mountain Site Characterization Project, 18:32478 (R;US)
Using computerized tomography to determine ionospheric structures: Part 1, Notivation and basic approaches, 18:34004 (R;US)
Using computerized tomography to determine ionospheric structures: Part 2, A method using curved paths to increase vertical resolution, 18:34005 (R;US)
Visualization for applications in shock physics, 18:34003 (R;US)
Volatile organic monitor for industrial effluents, 18:33783 (R;US)
Vulnerability assessment using two complementary analysis tools, 18:32609 (R;US)
Vulnerability assessment using two complementary analysis tools, 18:32613 (R;US)
Waste Isolation Pilot Plant Materials Interface Interactions Test: Papers presented at the Commission of European Communities workshop on in situ testing of radioactive waste forms and engineered barriers, 18:32482 (R;US)
Waste Isolation Pilot Plant simulated RH TRU waste experiments: Data and interpretation pilot, 18:32470 (R;US)
Wetting behavior of alternative solder alloys, 18:33442 (R;US)
[Travel to Aldermaston, UK for the SUBWOG 6P meeting and to Noordwijk, Netherlands and Abingdon, England to visit the European Space Research and Technology Center and AEA Industrial Technology, Culham Laboratory]: Foreign trip report, May 29–June 10, 1992, 18:33704 (R;US)
[Travel to Russia and Kazakhstan to participate in a fact finding visit to space nuclear propulsion and power facilities in the Commonwealth of Independent States (CIS)]: Foreign trip report, September 19–28, 1992, 18:32783 (R;US)

Sandia National Labs., Livermore, CA (United States)

Coal combustion science quarterly progress report, October–December 1992: Task 1, Coal char combustion [and] Task 2, Fate of mineral matter, 18:32246 (R;US)
Environmental Monitoring Plan, 18:33785 (R;US)
Participation in the 3rd international conference on ion microprobe research and technology: Foreign trip report, June 6–19, 1992, 18:34462 (R;US)
Slow cook-off test results for RX-08-FK in a toroidal composite vessel: Test Two, 18:33724 (R;US)
Travel to Australia to attend a workshop on INTRAVAL, an International Project to Study Validation of Geosphere Transport Models: Foreign trip report, February 10–14, 1992, 18:32367 (R;US)
Travel to Europe to coordinate testing of tower receivers and review status of solar chemical energy storage research: Foreign trip report, June 13–24, 1993, 18:32696 (R;US)
Travel to Europe to visit various underground waste disposal sites: Foreign trip report, May 10–20, 1993, 18:32371 (R;US)
Travel to Japan for collaborative research in modelling of flames: Foreign trip report, April 2–May 7, 1992, 18:33342 (R;US)

Travel to Japan for Material Chemistry 1992 symposium and to collaborate on fusion reactor materials research: Foreign trip report, March 9–17, 1992, 18:34596 (R;US)

Savannah River Lab., Aiken, SC (United States)
Report on survey of incinerator facilities at four ERDA sites, 18:32488 (R;US)

Schafer (W.J.) Associates, Inc., Wakefield, MA (United States)
Osiris and SOMBRERO inertial confinement fusion power plant designs: Volume 1, Executive summary and overview, Final report, 18:34586 (R;US)
Osiris and SOMBRERO inertial confinement fusion power plant designs: Volume 2, Designs, assessments, and comparisons, Final report, 18:34587 (R;US)

Science Applications International Corp., Golden, CO (United States)
An assessment of radiolytic gas generation: Impacts from Rocky Flats Plant residue elimination alternatives: Final report, 18:32417 (R;US)

Science Applications International Corp., Oak Ridge, TN (United States)
Remedial investigation work plan for Bear Creek Valley Operable Unit 2 (Rust Spoil Area, SY-200 Yard, Spoil Area 1) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Environmental Restoration Program, 18:32550 (R;US)

Servo-Dynamics, Inc., Santa Barbara, CA (United States)
Instrumentation of Dynamic Gas Pulse Loading system: Final technical report, 18:32270 (R;US)

Siemens AG Unternehmensbereich KWU, Erlangen (Germany)
Reactor safety issues resolved by the 2D/3D Program: International Agreement Report, 18:32939 (R;US)

Solarex Corp., Frederick, MD (United States)
Photovoltaic concentrator initiative: Concentrator cell development, 18:32689 (R;US)

Southeastern Universities Research Association, Inc., Newport News, VA (United States)
Travel to England to discuss final design of the CLAS TORUS: Foreign trip report, June 5–10, 1992, 18:33584 (R;US)
Travel to Europe concerning quadrupole designs at Saclay: Foreign trip report, December 3, 1992–March 7, 1993, 18:33585 (R;US)
Travel to Italy to visit the DAΦNE collider advisory committee: Foreign trip report, January 16, 1993–January 23, 1993, 18:33473 (R;US)

Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility
Alignment of CEBAF cryomodules, 18:33575 (R;US)
Beam energy measurement using the ARC beam line as a spectrometer, 18:33578 (R;US)
Beam raster system at CEBAF, 18:33577 (R;US)
Integrated numerical modeling of a laser gun injector, 18:33580 (R;US)
Laser powered beam conditioner for free-electron lasers and synchrotrons, 18:33499 (R;US)
Performance of a 1500 MHz niobium cavity with 2K-LHe channel cooling, 18:33579 (R;US)
Performance of a CEBAF production cavity after high-temperature heat treatment, 18:33581 (R;US)
Performance of production SRF cavities for CEBAF, 18:33576 (R;US)
Solvents and pumpdown characteristics of SRF Nb cavities, 18:34488 (R;US)
Spin structure functions of the nucleon at low Q^2 and ν, 18:34052 (R;US)

Southern Co. Services, Inc., Birmingham, AL (United States)
Innovative Clean Coal Technology (ICCT): 180 MW demonstration of advanced tangentially-fired combustion techniques for the reduction of nitrogen oxide (NO_x) emissions from coal-fired boilers: Fourth quarterly technical progress report, [October–December, 1992], 18:32229 (R;US)
Travel to Europe to meet selective catalytic reduction catalyst suppliers: Foreign trip report, August 24–September 1, 1991, 18:32198 (R;US)
[Demonstration of selective catalytic reduction technology for the control NO_x emissions from high sulfur coal fired boilers]: Phase 3, Final report, 18:32760 (R;US)

Southern Methodist Univ., Dallas, TX (United States). Dept. of Geological Sciences
Temperatures and heat flow in INEL-GT1 and WO-2 boreholes, Snake River Plain, Idaho, 18:32723 (R;US)

Southwest Research Inst., San Antonio, TX (United States)
Contained high explosive firing facility (CHEFF), 18:33717 (R;US)
Evaluation of aftermarket LPG conversion kits in light-duty vehicle applications: Final report, 18:33126 (R;US)

Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory Analyses
A literature review of coupled thermal-hydrologic-mechanical-chemical processes pertinent to the proposed high-level nuclear waste repository at Yucca Mountain, 18:32460 (R;US)
A survey of hydrothermal modeling related to Yucca Mountain, 18:32447 (RA;US)
Apache leap watershed study, 18:32435 (RA;US)
Appraising the use of environmental tracers to determine groundwater recharge rates: The impact of media anisotropy, 18:32453 (RA;US)
Characterization of rock hydrologic properties using model verification, 18:32440 (RA;US)
Coupled processes, 18:32445 (RA;US)
Does the wind blow through Yucca Mountain?, 18:33817 (RA;US)
Evaluation of tracers for hydrologic studies at Yucca Mountain, 18:32450 (RA;US)
Field testing the effectiveness of pumping to remove sulfur hexafluoride traced drilling air from a prototype borehole near superior, Arizona, 18:32438 (RA;US)
Flow through nonhomogeneous porous media, 18:32449 (RA;US)
Geochemical and isotopic studies in the Apache leap region, 18:32437 (RA;US)
Ground water flow through unsaturated fractured rock research needs, 18:32442 (RA;US)
Hydrogeologic issues at Yucca Mountain: Findings of a DOE peer review team, 18:32534 (RA;US)
Hydrologic research for performance assessment, 18:32429 (RA;US)
Isotopic tracers for water and solute movement in desert soils, 18:32452 (RA;US)
Modeling heterogeneous unsaturated flow systems, 18:32443 (RA;US)
Modeling hydrothermal flow in variably saturated, fractured, welded tuff during the prototype engineered barrier system field test of the Yucca Mountain Project, 18:32446 (RA;US)
Nonequilibrium fracture-matrix flow during episodic infiltration events in Yucca Mountain, 18:32432 (RA;US)
Nonisothermal hydrologic transport study at the Apache Leap Tuff site, 18:32434 (RA;US)
Nonisothermal laboratory and numerical experiment results, 18:32448 (RA;US)
NRC high-level radioactive waste research at CNWRA, July–December 1992: Volume 3, No. 2, 18:32459 (R;US)
Numerical and laboratory investigations of transient and steady-state flow in a fractured core, 18:32441 (RA;US)
On the relationship between information content and model structure: Advective travel (time) versus dispersion, 18:32430 (RA;US)
Pneumatic permeability measurements in a fractured, partially saturated environment, 18:32436 (RA;US)
Technical issues related to groundwater flow and radionuclide transport in unsaturated fractured rock, 18:32458 (RA;US)
Technical questions related to modeling groundwater flow and radionuclide transport in unsaturated fractured rock, 18:32455 (RA;US)
Technical questions related to modeling ground water flow and radionuclide transport in unsaturated, fractured rock, 18:32456 (RA;US)
Technical questions related to modeling groundwater flow and radionuclide transport in unsaturated, fractured rock, 18:32457 (RA;US)
The behavior of simple fluids in microfractures, 18:32439 (RA;US)

The composition and CO_2 carbon isotope signature of gases from borehole USW UZ-6, Yucca Mountain, Nevada, 18:32451 (RA;US)
Tracer transport in fractures, 18:32431 (RA;US)
Unsaturated flow and transport research questions and priorities, 18:32454 (RA;US)
Update on intraval-phase II test cases, 18:32433 (RA;US)
Use of a submersible pressure outflow cell for determination of moisture characteristic curves on rock core, 18:32444 (RA;US)

SPAR Aerospace Ltd., Brampton, ON (Canada)
Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 1, Final report, 18:34588 (R;US)
Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 2, Final report, 18:34589 (R;US)
Inertial Fusion Energy Reactor Design Studies: Prometheus-L, Prometheus-H: Volume 3, Final report, 18:34590 (R;US)

Spire Corp., Bedford, MA (United States)
Gallium arsenide-based ternary compounds and multi-band-gap solar cell research: Final subcontract report, 1 April 1988–31 March 1990, 18:32686 (R;US)

SRI International, Menlo Park, CA (United States)
Highly dispersed catalysts for coal liquefaction: Quarterly report No. 6, November 23, 1992–February 22, 1993, 18:32164 (R;US)
Novel catalysts for methane activation: Quarterly report No. 2, January 1, 1993–March 31, 1993, 18:33330 (R;US)
Novel mass spectrometric instrument for gaseous and particulate characterization and monitoring: Technical progress report, January 1, 1993–March 31, 1993, 18:33763 (R;US)

Stanford Linear Accelerator Center, Menlo Park, CA (United States)
Current experiments in elementary particle physics: Revised, 18:34021 (R;US)
The personnel protection system for a Synchrotron Radiation Accelerator Facility: Radiation safety perspective, 18:33485 (R;US)

Stanford Univ., CA (United States). Dept. of Civil Engineering
Nitration of polynuclear aromatic hydrocarbons in coal combustors and exhaust streams: Quarterly report, January 1, 1993–March 31, 1993, 18:32249 (R;US)

Stanford Univ., CA (United States). Petroleum Research Inst.
Kinetics of in situ combustion: SUPRI TR 91, 18:32257 (R;US)
SUPRI heavy oil research program: Annual report, October 1, 1991–September 30, 1992, 18:32259 (R;US)

Stanford Univ., CA (United States). Systems Optimization Lab.
On the numerical stability of quasi-definite systems, 18:34684 (R;US)
The simplex algorithm with a new primal and dual pivot rule, 18:34685 (R;US)

State Planning Commission of China, Beijing, BJ (China). Energy Research Inst.
China energy databook: Revision 2, 1992 edition, 18:33043 (R;US)

State Univ. of New York, Buffalo, NY (United States)
[X-ray studies of microstructures in semiconductor and superconducting materials]: Performance report, 18:33254 (R;US)

State Univ. of New York, Stony Brook, NY (United States)
[Research in nuclear astrophysics: Stellar collapse and supernovae], 18:33997 (R;US)

Statens Straalevern, Oesteraas (Norway)
Calibration of the Norwegian standards for measuring ionizing radiation in radiotherapy, 18:33958 (R;NO;In Norwegian)
Individual measurements of external radiation doses from Chernobyl fallout in Oeystre Slidre, 18:33957 (R;NO;In Norwegian)
Statens Straalevern, 18:34634 (I;NO;In Norwegian)

Stone and Webster Engineering Corp., Denver, CO (United States)
TA-16 steam plant evaluation: Volume 1: Final report, 18:32755 (R;US)
TA-16 steam plant evaluation: Final report–Volume II, appendix, 18:33114 (R;US)

SunPower Corp., Sunnyvale, CA (United States)
High-efficiency silicon concentrator cell commercialization, 18:32692 (R;US)

Superconducting Super Collider Lab., Dallas, TX (United States)
2 TeV HEB beam abort at the SSCL, 18:33625 (R;US)
A liquid helium cryogenic system design for the GEM magnet, 18:33626 (R;US)
A methodology to describe process control requirements, 18:33619 (R;US)
A study of the effect of cable insulation on coil properties, 18:33618 (R;US)
An engineering design study of alternative design options for the forward toroids of the SSC SDC detector, 18:33629 (R;US)
Beam loading effect in SSCL coupled cavity linac, 18:33513 (R;US)
Cold test facility for 1.8 m superconducting model magnets at the SSC, 18:33627 (R;US)
Data Acquisition for detector prototypes at the SSCL, 18:33628 (R;US)
Data-machine independence (DMI), 18:34686 (R;US)
Design of a tunnel cooling system, 18:33623 (R;US)
Development of hermetic electrical connectors for SSC spool pieces, 18:33458 (R;US)
Engineered design of SSC cooling ponds, 18:33622 (R;US)
Industry participation in the SSCL installation program, 18:33487 (R;US)
Lamination and end pack design studies of SSC low energy booster magnet prototypes, 18:33624 (R;US)
Lattice design study for the HEB to collider transfer lines, 18:33511 (R;US)
Longitudinal beam dynamics with rf noise, 18:33510 (R;US)
Measurements of ground motion and SSC dipole vibrations, 18:33486 (R;US)
Mechanical analysis of the DSB cross-section, 18:33621 (R;US)
Minimal interference beam size/profile measurement techniques applicable to the Collider, 18:33512 (R;US)
Multilayer insulation for the interconnect region in the Accelerator System String Test: A practical engineering approach for a new scheme of design and installation bridges, 18:33617 (R;US)
Preliminary results from a study of collar lamination variation in SSC Prototype Dipole Magnets, 18:33616 (R;US)
Radiation environment and shielding for the GEM experiment at the SSC, 18:33630 (R;US)
Summary of dipole field angle measurements on 50mm-aperture SSC Collider Dipole Magnet Protoypes, 18:33620 (R;US)
The linkage of Zlib to Teapot for auto-differentiation map extraction and nonlinear analysis, 18:33514 (R;US)

Swedish Inst. of Space Physics, Kiruna (Sweden)
Phase-space description of plasma waves. Linear and nonlinear theory, 18:34509 (R;SE)

Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden)
Geothermal energy recovery from sedimentary rock, 18:32720 (R;SE;In Swedish, English)
High resolution electron microscopy of catalytic substances - especially zeolites and metals: Final report, 18:33189 (R;SE)
Reduction of nitrogen oxides in exhaust gases from diesel engines in a 5 kW stainless steel CFB-plant, 18:33777 (R;SE;In Swedish)

Swedish National Testing and Research Inst., Boraas (Sweden)
Variable amplitude fatigue, modelling and testing, 18:33200 (R;SE;In English, Swedish)

Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden)
Treatment and final disposal of nuclear waste: Detailed R and D-programme 1993-1998, 18:32428 (R;SE)

Swedish Nuclear Power Inspectorate, Stockholm (Sweden)
Consequences of reactor fuel damage: - Production of radioactive wastes. - Radioactivity in the reactor cooling system, 18:32815 (R;SE;In Swedish)

Swedish Radiation Protection Inst., Stockholm (Sweden)
Project Radiation Protection - East: Status report, 18:34640 (R;SE;In Swedish)
Studies on the waste depository of the Sillamaee plant, 18:33853 (R;SE)

Syracuse Univ., NY (United States)
Research on defects and transport in amorphous-silicon-based semiconductors: Annual subcontract report, 20 February 1992–19 February 1993, 18:32687 (R;US)

T

Talandic Research Corp., Irwindale, CA (United States)
[Atomic Vapor Laser Isotope Separation (AVLIS) program]: Final report, [January–July 1992], 18:32333 (R;US)

Tampella Power Corp., Williamsport, PA (United States)
Toms Creek Integrated Gasification Combined Cycle Demonstration Project: Final quarterly technical progress report for the period ending March 31, 1993, 18:32752 (R;US)

Tampella Power, Marietta, GA (United States)
LIFAC Sorbent Injection Desulfurization Demonstration Project: Quarterly report No. 10, January–March 1993, 18:32764 (R;US)

Technical Univ. of Denmark, Lyngby (Denmark). Inst. of Mathematical and Operations Research
Non-linear regulation of petrol motors, 18:33120 (R;DK;In Danish)

TECOGEN, Inc., Waltham, MA (United States)
Integrated emissions control system for residential CWS furnace: Final report, September 20, 1989–March 20, 1993, 18:32232 (R;US)

Teledyne Energy Systems, Timonium, MD (United States)
Special Applications RTG Technology Program: Thermoelectric module development summary report, 18:33055 (R;US)

Tennessee Dept. of Health, Nashville, TN (United States)
Tennessee Health Studies Agreement: Annual report for year 1, August 15, 1991–December 31, 1992, 18:32554 (R;US)

Tennessee Technological Univ., Cookeville, TN (United States)
Pressurized Fluidized-Bed Hydroretorting of eastern oil shales: Final report, June 1992–January 1993, 18:32330 (R;US)

Tennessee Univ., Knoxville, TN (United States). Dept. of Chemistry
Numerical estimation of adsorption energy distributions from adsorption isotherm data with the expectation-maximization method, 18:33323 (R;US)

Tennessee Univ., Tullahoma, TN (United States). Space Inst.
Anion-exchange resin-based desulfurization process: Quarterly technical progress report, April 1, 1993–June 30, 1993, 18:32762 (R;US)

Texas Univ., Austin, TX (United States). Bureau of Economic Geology
Characterization of facies and permeability patterns in carbonate reservoirs based on outcrop analogs: Final report, 18:32250 (R;US)
Hydrogeochemical and production controls on NORM in oil- and gas- field operations: Technical progress report, April 1, 1993–June 30, 1993, 18:32303 (R;US)

Texas Univ., Austin, TX (United States). Center for Electromechanics
Pulsed power supply for Nova Upgrade: Final report, August 1, 1991 to March 31, 1992, 18:34618 (R;US)

Texas Univ., Austin, TX (United States). Dept. of Petroleum Engineering
A novel approach to modeling unstable EOR displacements: Quarterly report, April 1993–June 1993, 18:32260 (R;US)
Microbial enhanced oil recovery research: Final report, Annex 5, 18:32256 (R;US)

Texas Univ., Austin, TX (United States). Dept. of Physics
Laser wakefield excitation and measurement on a femtosecond time scale: Theory and experiment: Progress report, September 1, 1992–August 31, 1992, 18:34444 (R;US)

Texas Univ., Austin, TX (United States). Inst. for Fusion Studies
Finite beta plasma equilibrium in toroidally linked mirrors, 18:34504 (R;US)
Ion mobility and transport barriers in the tokamak plasmas, 18:34503 (R;US)
On neutral plasma oscillations, 18:34502 (R;US)

Texas Univ., Houston, TX (United States). Cancer Center
Diagnostic and therapeutic applications of diode lasers and solid state lasers in medicine: Progress report, 18:33864 (R;US)

Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study
Nucleon-nucleon scattering lengths in QCD sum rules, 18:34032 (R;JP)

Trane Co., La Crosse, WI (United States)
Compatibility of refrigerants and lubricants with motor materials: Volume 1, Final report, 18:33249 (R;US)
Compatibility of refrigerants and lubricants with motor materials: Volume 2, Effects of refrigerant exposures on motor materials, 18:33250 (R;US)
Compatibility of refrigerants and lubricants with motor materials: Volume 3, Effects of refrigerant-lubricant exposures on motor materials, 18:33251 (R;US)

TRIUMF, Vancouver, BC (Canada)
Measurements of NN → dπ near threshold, 18:34051 (R;CA)
Some results on the use of avalanche photodiodes for scintillating fiber readout, 18:33685 (R;CA)

Trondheim Univ. (Norway). Norges Tekniske Hoegskole
A computer vision system for an autonomous underwater vehicle, 18:33435 (R;NO)
Cloud-points of hydrocarbon systems: Influence of pressure and methane addition, 18:32274 (R;NO)
Diffusion coefficient measurements in gas/oil mixtures at high pressure by nuclear magnetic resonance, 18:32273 (R;NO)
Heat transfer of finned tube bundles in crossflow with and without partial condensation, 18:32325 (R;NO)
Ignition and flame growth in lean gas-air mixtures: An experimental study with a schlieren system, 18:33121 (R;NO)
Modeling and control of submerged-arc ferrosilicon furnaces, 18:33110 (R;NO)
Some aspects of floating ice related to sea surface operations in the Barents sea, 18:32289 (R;NO)
Sparse solution of finite element equations, 18:34666 (R;NO)

TRW Space and Electronics Group, Redondo Beach, CA (United States)
Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 1, Final report, 18:34588 (R;US)
Inertial Fusion Energy reactor design studies: Prometheus-L, Prometheus-H: Volume 2, Final report, 18:34589 (R;US)
Inertial Fusion Energy Reactor Design Studies: Prometheus-L, Prometheus-H: Volume 3, Final report, 18:34590 (R;US)

TRW Space and Electronics Group, Redondo Beach, CA (United States). Applied Technology Div.
MHD Integrated Topping Cycle Project: Twentieth quarterly technical progress report, May 1, 1992–July 31, 1992, 18:33052 (R;US)
MHD Integrated Topping Cycle Project: Twenty-first quarterly technical progress report, August 1, 1992–October 31, 1992, 18:33053 (R;US)

TRW Space and Technology Group, Redondo Beach, CA (United States). Applied Technology Div.
MHD Technology Transfer, Integration and Review Committee: Seventh semi-annual status report, April 1991–September 1991, 18:33054 (R;US)

TRW, Inc., Redondo Beach, CA (United States). Spacecraft Technology Div.
Integrated Product Development and Networking: Final report, 18:33345 (R;US)

Tufts Univ., Medford, MA (United States)
High Energy Physics at Tufts University: Progress report, 1992–1993, 18:34017 (R;US)

Tufts Univ., Medford, MA (United States). Dept. of Physics and Astronomy
Investigation of the relative abundance of heavy versus light nuclei in primary cosmic rays using underground muon bundles, 18:33998 (R;US)

Tuskegee Univ., AL (United States). Dept. of Chemical Engineering
Adsorption of various alcohols on Illinois No. 6 coal in aqueous solutions, 18:32184 (R;US)

U

Unidynamics/Phoenix, Inc., AZ (United States)
Pyrotechnic study and test: Final report, 18:33714 (R;US)

United Nations Development Programme
Agricultural production - Phase 2. Indonesia. Isolation of arboviruses, their identification and the identification of their culicoides vectors in Indonesia: Technical report. Report prepared for the Government of the Republic of Indonesia, 18:33890 (R;XA)

Agricultural production - Phase 2. Indonesia. Application of molasses-urea blocks to ruminant production in Indonesia: Technical report. Report prepared for the Government of the Republic of Indonesia, 18:33891 (R;XA)
Agricultural production - Phase 2. Indonesia. Rice - azolla - fish culture - use of nuclear technique: Technical report. Report prepared for the Government of the Republic of Indonesia, 18:33892 (R;XA)
Agricultural production - Phase 2. Indonesia. Methods for increasing ruminant production from available feed resources in Indonesia - nutrition-reproduction interactions: Technical report. Report prepared for the Government of the Republic of Indonesia, 18:33893 (R;XA)
Improving food and agricultural production. Thailand. Biological nitrogen fixation: Technical report. Report prepared for the Government of the Republic of Thailand, 18:33894 (R;XA)
Improving food and agricultural production. Thailand. Fertilizer experiments - data analysis and interpretation of results: Technical report. Report prepared for the Government of the Republic of Thailand, 18:33895 (R;XA)
Improving food and agricultural production. Thailand. Mutation breeding of food legumes: Technical report. Report prepared for the Government of the Republic of Thailand, 18:33896 (R;XA)
Improving food and agricultural production. Thailand. Improving the reproductive performance of large and small ruminants in Thailand: Technical report. Report prepared for the Government of the Republic of Thailand, 18:33897 (R;XA)
Improving food and agricultural production. Thailand. Application on monoclonal antibodies for progesterone measurement: Technical report. Report prepared for the Government of the Republic of Thailand, 18:33898 (R;XA)
Improving food and agricultural production. Thailand. Improving food and agricultural production with nuclear and related technology: Technical report. Report prepared for the Government of the Republic of Thailand, 18:33899 (R;XA)

United Solar Systems Corp., Troy, MI (United States)
Research on stable, high-efficiency amorphous silicon multijunction modules: Annual subcontract report, 1 January 1992–28 February 1993, 18:32685 (R;US)

University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering
Modification of chemical and physical factors in steamflood to increase heavy oil recovery: Annual report, October 1, 1991–September 30, 1992, 18:32258 (R;US)

University of Wyoming Research Corp., Laramie, WY (United States). Western Research Inst.
The use of solid-state NMR techniques for the analysis of water in coal and the effect of different coal drying techniques on the structure and reactivity of coal: Quarterly report, March 1–May 31, 1993, 18:32167 (R;US)

UOP, Inc., Des Plaines, IL (United States)
Proof-of-concept testing of fluidized-bed copper oxide process: Phase 4, conceptual design and economic evaluation: Technical progress report No. 4-4, October 1992–March 1993, 18:32758 (R;US)

URS/John A. Blume and Associates, Engineers, San Francisco, CA (United States)
Processed seismic motion records from Big Bear, California earthquake of June 28, 1992, recorded at seismograph stations in southern Nevada, 18:33981 (R;US)
Processed seismic motion records from St. George, Utah earthquake of September 2, 1992, recorded at seismic stations in southern Nevada, 18:33982 (R;US)
Processed seismic motion records from Desert Hot Springs, California earthquake of April 22, 1992, recorded at seismic stations in southern Nevada, 18:33978 (R;US)
Processed seismic motion records from Little Skull Mountain, Nevada earthquake aftershocks of July 5, 1992 and September 13, 1992, recorded at seismic stations in southern Nevada, 18:33979 (R;US)
Processed seismic motion records from Landers, California earthquake of June 28, 1992, recorded at seismograph stations in southern Nevada, 18:33980 (R;US)

USAEC Hanford Operations Office, Richland, WA (United States)
Office of Hanford Directed Operations activities for week of October 27, 1947, 18:32836 (R;US)
Office of New York Directed Operations activities for week ending October 31, 1947, 18:32837 (R;US)
Report of Hanford Directed Operations weekly activity, [January 28, 1948], 18:32849 (R;US)
[Office of Hanford Directed Operations significant happenings for week ending May 19, 1948], 18:32853 (R;US)
[Office of Hanford Directed Operations significant events for week ending June 9, 1948], 18:32854 (R;US)
[Office of Hanford Directed Operations major events for week ending June 16, 1948], 18:32855 (R;US)
[Office of Hanford Directed Operations significant events for week ending June 23, 1948], 18:32856 (R;US)
[Office of Hanford Directed Operations events of major importance for week ending July 7, 1948], 18:32857 (R;US)
[Office of Hanford Directed Operations events of importance for week ending July 14, 1948], 18:32858 (R;US)
[Office of Hanford Directed Operations events of importance for week ending July 21, 1948], 18:32859 (R;US)
[Office of Hanford Directed Operations events of importance for week ending July 28, 1948], 18:32860 (R;US)
[Office of Hanford Directed Operations events of importance for week ending August 11, 1948], 18:32861 (R;US)
[Office of Hanford Directed Operations events of importance for week ending August 18, 1948], 18:32862 (R;US)
[Office of Hanford Directed Operations events of importance for week ending August 25, 1948], 18:32863 (R;US)
[Office of Hanford Directed Operations events of importance for week ending September 8, 1948], 18:32864 (R;US)
[Office of Hanford Directed Operations events of importance for week ending September 15, 1948], 18:32865 (R;US)
[Office of Hanford Directed Operations events of importance for week ending September 1, 1948], 18:32866 (R;US)
[Office of Hanford Directed Operations events of importance for week ending September 22, 1948], 18:32867 (R;US)
[Office of Hanford Directed Operations events of importance for week ending September 29, 1948], 18:32868 (R;US)
[Office of Hanford Directed Operations events of importance for week ending October 6, 1948], 18:32869 (R;US)
[Office of Hanford Directed Operations events of importance for week ending October 13, 1948], 18:32870 (R;US)
[Office of Hanford Directed Operations events of importance for week ending October 20, 1948], 18:32871 (R;US)
[Office of Hanford Directed Operations events of importance for week ending October 27, 1948], 18:32872 (R;US)
[Office of Hanford Directed Operations events of importance for week ending November 10, 1948], 18:32873 (R;US)
[Office of Hanford Directed Operations events of importance for week ending November 17, 1948], 18:32874 (R;US)
[Office of Hanford Directed Operations events of importance for week ending November 24, 1948], 18:32875 (R;US)
[Office of Hanford Directed Operations events of importance for week ending December 1, 1948], 18:32876 (R;US)
[Office of Hanford Directed Operations events of importance for week ending December 8, 1948], 18:32877 (R;US)
[Office of Hanford Directed Operations events of importance for week ending December 29, 1948], 18:32878 (R;US)
[Office of Hanford Directed Operations events of importance for week ending January 5, 1949], 18:32879 (R;US)
[Office of Hanford Directed Operations events of importance for week ending January 12, 1949], 18:32880 (R;US)
[Office of Hanford Directed Operations events of importance for week ending February 2, 1949], 18:32881 (R;US)
[Office of Hanford Directed Operations events of importance for week ending February 9, 1949], 18:32882 (R;US)
[Office of Hanford Directed Operations activities for week of 20 October, 1947], 18:32835 (R;US)
[Office of Hanford Directed Operations events of importance for week ending March 2, 1949], 18:32883 (R;US)
[Office of Hanford Directed Operations events of importance for week ending April 6, 1949], 18:32884 (R;US)

[Office of Hanford Directed Operations events of importance for week ending April 13, 1949], 18:32885 (R;US)

USDOE Pittsburgh Energy Technology Center, PA (United States)

Engineering foundation conference: The impact of ash deposition on coal fired plants: Foreign trip report, June 15–27, 1993, 18:32220 (R;US)

Krakow Clean Fossil Fuel and Energy Efficiency Project planning committee visit to Poland: Foreign trip report, April 8–15, 1991, 18:32207 (R;US)

Rheological properties essential for the atomization of coal water slurries (CWS): Quarterly progress report, March 15–June 15, 1993, 18:32235 (R;US)

Travel to Australia for the 27th meeting of the International liaison Group on magnetohydrodynamics electrical power generation: Foreign trip report, July 5–July 15, 1991, 18:33051 (R;US)

Travel to Austria to conduct ash and deposit formation testing on US and Australian coals at SECV 10E06 Btu/hr facility: Foreign trip report, May 13–24, 1991, 18:32218 (R;US)

Travel to Canada for the Natural Gas Conversion Conference for the purpose of exchanging information on technology advances and future challenges of natural gas conversion to fuels and chemicals: Foreign trip report, June 12, 1991–June 15, 1991, 18:32319 (R;US)

Travel to Europe to meet selective catalytic reduction catalyst suppliers: Foreign trip report, August 24–September 1, 1991, 18:32198 (R;US)

Travel to France as a DOE representative to the Fifth US-European Coal Conference in regard to increased export of US coals to Europe: Foreign trip report, April 29–May 5, 1991, 18:32248 (R;US)

Travel to India as representatives of TVA concerning programs on thermal power plants: Foreign trip report, March 7–18, 1992, 18:32750 (R;US)

Travel to India to aid in design of their coal Fuel Evaluation Test Facility: Foreign trip report, January 23–February 7, 1992, 18:32216 (R;US)

Travel to Poland for equipment capability assessments in clean burning coal combustion facilities: Foreign trip report, October 13–20, 1990, 18:32217 (R;US)

Travel to Poland for Krakow Clean Fossil Fuels and Energy Efficiency Project: Foreign trip report, April 20–30, 1992, 18:32206 (R;US)

Travel to Poland for the 12th International Coal Preparation Congress: Foreign trip report, September 15–23, 1991, 18:32208 (R;US)

Travel to Poland to discuss Skawina Clean Coal Retrofit Project and Krakow Clean Fossil Fuel and Energy Efficiency Project: Foreign trip report, December 9–14, 1991, 18:32213 (R;US)

Travel to Poland to evaluate projects to reduce pollution from combustion equipment: Foreign trip report, January 19–26, 1992, 18:32205 (R;US)

Travel to Poland to review Krakow Clean Fossil Fuels and Energy Efficiency Project: Foreign trip report, October 14–25, 1991, 18:32214 (R;US)

Travel to Poland to review the public relations program with the Polish firm selected to be responsible for this portion of the Krakow Clean Fossil Fuels and Energy Efficiency Project: Foreign trip report, March 2–6, 1992, 18:32215 (R;US)

Travel to United Kingdom for conference on coal science: Foreign trip report, September 16–20, 1991, 18:32212 (R;US)

USDOE Richland Field Office, WA (United States)

Hanford Mission Plan: Volume 1, Site Guidance, 18:32386 (R;US)

Hanford Waste Vitrification Plant Project Plan: Revision 1, 18:32412 (R;US)

National emission standards for hazardous air pollutants application for approval to construct rotary mode core-sampling truck and exhauster, 18:32387 (R;US)

Quality assurance program description: Hanford Waste Vitrification Plant, Part 1: Revision 3, 18:32413 (R;US)

Quarterly report of RCRA groundwater monitoring data for period January 1, 1993 through March 31, 1993, 18:32532 (R;US)

USDOE Richland Operations Office, WA (United States)

1992 Toxic Chemical Release Inventory: Emergency Planning and Community Right-To-Know-Act of 1986 Section 313, 18:33748 (R;US)

200 Area Effluent Treatment Facility: Delisting petition: Revision 1, 18:32385 (R;US)

2101-M pond closure plan: Volume 1, Revision 2, 18:32555 (R;US)

Hanford Site background: Part 1, Soil background for nonradioactive analytes: Revision 1, Volume 1, 18:32384 (R;US)

Radioactive air emissions program notice of construction, rotary mode core-sampling truck and exhauster, 18:32388 (R;US)

The 4843 Alkali Metal Storage Facility Closure Plan, 18:32383 (R;US)

Toxic air pollutants notice of construction, rotary mode core-sampling truck and exhauster, 18:32389 (R;US)

USDOE Savannah River Field Office, Aiken SC (United States)
Environmental Assessment for the ammunition storage facility at the Savannah River Site, 18:33713 (R;US)

USDOE Yucca Mountain Site Characterization Project Office, Las Vegas, NV (United States)
Yucca Mountain Site Characterization Project: Technical data catalog,(quarterly supplement), 18:32391 (R;US)

USDOE, Washington, DC (United States)
Conference on natural gas use state regulation and market dynamics in the Post 636/Energy Policy Act Era: Proceedings, 18:32320 (R;US)
DOE fundamentals handbook: Mechanical science: Volume 2, 18:33343 (R;US)
DOE/FE technical team visit to Chile under the protocol of intent to cooperate in the deployment of Clean Coal Technologies: Foreign trip report, October 1–5, 1990, 18:32219 (R;US)
Environmental Assessment for Central Power and Light Company's proposed Military Highway-CFE tie 138/69-kV transmission line project Brownsville, Cameron County, Texas, 18:32960 (R;US)
Proposed amendment for Presidential Permit PP-63 and associated modifications to 500 kV international transmission line, Forbes, Minnesota to Manitoba, Canada Northern States Power Company: Final Environmental Assessment, 18:32963 (R;US)
Third G-24 Nuclear Safety Working Group meeting in Brussels, Belgium: Foreign trip report, February 22–28, 1992, 18:32914 (R;US)
Transuranic waste technology development International Technology Exchange Program: Volume 2, Appendices: Final trip report, October 17–20, 1989, 18:32359 (R;US)
Travel to Japan regarding radioactive beam aspects of high energy nuclear physics research: Foreign trip report, May 29–June 4, 1993, 18:34020 (R;US)
Travel to Poland to review the desulfurization of coals using pyrolysis project which is being conducted at the Institute for Chemical Processing of Coal: Foreign trip report, June 16–26, 1991, 18:32157 (R;US)
[Travel to attend the US electric power technologies conference held in Prague, Czechoslovakia]: Foreign trip report, July 7–9, 1992, 18:32796 (R;US)
[Travel to Moscow, Russia to discuss nuclear power plant aging and life extension]: Foreign trip report, October 12–20, 1992, 18:32908 (R;US)
[Travel to Vienna, Austria and Brussels, Belgium to meet with IAEA persons involved in DOE/AID assistance program and to meet with G-24 to coordinate AID to CEEC and FSU]: Foreign trip report, July 13–17, 1992, 18:32909 (R;US)
[Travel to Vilnius, Lithuania, Vienna, Austria, Bratislava and Prague Czechoslovakia to assess nuclear related needs for Lithuania and to discuss future nuclear safety assistance efforts with all of the countries visited]: Foreign trip report, September 16–24, 1992, 18:32910 (R;US)

Utilitip, Inc., Rock Hill, SC (United States)
Tip stabilizer for a chain saw: Final report, 18:33105 (R;US)

V

Viborgegnens Energi- og Miljoekontor, Viborg (Denmark)
Coherent plan of resources for a small-town community, 18:32981 (R;DK;In Danish)

Viet Nam National Atomic Energy Commission, Ha Noi (Viet Nam)
Review on the role of nuclear power, 18:33019 (R;VN;In Vietnamese)

Virginia Center for Coal and Minerals Processing, Blacksburg, VA (United States)
A Status of Advanced Coal Cleaning as a Compliance Technology, 18:32137 (RA;US)
Commercial column flotation of fine coal, 18:32144 (RA;US)
Commercial scale column flotation circuit at Powell Mountain Coal Company, 18:32143 (RA;US)
Dispersants for improving sulfur rejection in flotation, 18:32138 (RA;US)
Heavy-medium cycloning for fine coal processing, 18:32149 (RA;US)
Impact of the Clean Air Act Amendments of 1990, 18:32135 (RA;US)
Microcel™ column flotation, 18:32142 (RA;US)
New methods for enhancing sulfur rejection in flotation, 18:32139 (RA;US)
On-line analysis of coal, 18:32146 (RA;US)
Overview of the National Coal Preparation Program, 18:32136 (RA;US)
Simulation of high-efficiency coal cleaning, 18:32148 (RA;US)
Some recent developments in fine coal dewatering, 18:32145 (RA;US)
The application of the SHC process for fine coal cleaning, 18:32147 (RA;US)
The history of column flotation, 18:32141 (RA;US)
Use of the multi-gravity separator (MGS) for improved sulfur rejection, 18:32140 (RA;US)

Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States)
Investigations in gauge theories, topological solitons and string theories: Final report, 18:34023 (R;US)

Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Seismological Observatory
Virginia Regional Seismic Network: Final report (1986–1992), 18:32822 (R;US)

Virginia Univ., Charlottesville, VA (United States). Dept. of Mechanical, Aerospace and Nuclear Engineering
Systematic assembly homogenization and local flux reconstruction for nodal method calculations: Final report, January 1, 1990–September 30, 1992, 18:32798 (R;US)

W

Washington State Univ., Pullman, WA (United States)
Reactor fuel conversion assistance request: Technical progress report, August 15, 1992–May 14, 1993, 18:32825 (R;US)

Washington Univ., Seattle, WA (United States)
Institute for Nuclear Theory: Annual report No. 3, 1 March 1992–28 February 1993, 18:34063 (R;US)

Washington Univ., Seattle, WA (United States). Dept. of Geophysics
Beam-beam effects for the PEP-II B Factory, 18:33644 (R;US)

Washington Univ., Seattle, WA (United States). Dept. of Physics
SSC detector muon sub-system beam tests, 18:33582 (R;US)

West Virginia Univ., Morgantown, WV (United States)
Measuring and predicting reservoir heterogeneity in complex depositsystems: [Quarterly] report, April–June 1993, 18:32261 (R;US)

West Virginia Univ., Morgantown, WV (United States). Coll. of Engineering
Ground movements associated with gas hydrate production: Progress report, July 1–September 30, 1992, 18:32315 (R;US)
Ground movements associated with gas hydrate production: Progress report, January 1–March 31, 1993, 18:32316 (R;US)

West Virginia Univ., Morgantown, WV (United States). Dept. of Physics
Surface study of absorbents for the removal of SO_x and NO_x: [First quarterly report, March 1–May 31, 1988], 18:32759 (R;US)
[Surface study of absorbents for the removal of SO_x and NO_x]: Quarterly report, June 1, 1990–August 31, 1990, 18:33764 (R;US)
[Surface study of absorbents for the removal of SO_x and NO_x]: Quarterly report, September 1, 1990–November 30, 1990, 18:33765 (R;US)
[Surface study of absorbents for the removal of SO_x and NO_x]: Quarterly report, December 1, 1990–February 28, 1991, 18:32200 (R;US)

Western Michigan Univ., Kalamazoo, MI (United States)
Correlated charge-changing ion-atom collisions: Progress report, February 16, 1990–February 15, 1993, 18:34441 (R;US)
Cusp electron production in 75–300 keV He^+ + Ar collisions, 18:34439 (R;US)
Search for resonant electron transfer and double excitation in Kr^{34+} + H_2 collisions, 18:34438 (R;US)

Western Research Inst., Laramie, WY (United States)
Oil shale, tar sand, coal research, advanced exploratory process technology, jointly sponsored research: Quarterly technical progress report, April–June 1993, 18:32329 (R;US)
Oil shale, tar sand, coal research, advanced exploratory process technology, jointly sponsored research: Quarterly technical progress report, January–March 1993, 18:32158 (R;US)

Westinghouse Electric Corp., Carlsbad, NM (United States)
Public and institutional environmental education in the 1990s, 18:32401 (R;US)
The WIPP institutional program for states' involvement in WIPP transportation planning, and operations, 18:32343 (R;US)
WIPP waste acceptance criteria and transportation system, 18:32397 (R;US)

Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div.
Environmental monitoring and cooperative resource management at the WIPP site, 18:32402 (R;US)
Geomechanical monitoring system at the Waste Isolation Pilot Plant, Carlsbad, New Mexico, 18:32398 (R;US)
Geomechanical monitoring system at the Waste Isolation Pilot Plant, Carlsbad, New Mexico, 18:32404 (R;US)
No-migration variance petition: Appendices K–O, Response to notice of deficiencies: Volume 6, Revision 1, 18:32393 (R;US)
Safety at the Waste Isolation Pilot Plant, 18:32405 (R;US)
The WIPP decision plan: Charting the course for openness in the decision making process, 18:32400 (R;US)
Waste Isolation Pilot Plant No-Migration Variance Petition: Revision 1, Volume 1, 18:32392 (R;US)
Waste Isolation Pilot Plant No-migration variance petition: Addendum: Volume 7, Revision 1, 18:32394 (R;US)
Waste Isolation Pilot Plant: No-migration variance petition: Figures: Volume 8, Revision 1, 18:32395 (R;US)
Westinghouse-DOE integration: Meeting the challenge, 18:32399 (R;US)
WIPP alpha CAM fast alarm setpoints, 18:32403 (R;US)

Westinghouse Electric Corp., West Mifflin, PA (United States). Bettis Atomic Power Lab.
Environmental degradation of Alloy 600 and welded filler metal EN82 in an elevated temperature aqueous environment, 18:33207 (R;US)
Fail-safe storage rack for fuel rod assemblies, 18:32348 (PA;US)

Westinghouse Environmental Management Co. of Ohio, Cincinnati, OH (United States). Fernald Environmental Management Project
Electrofishing survey of the Great Miami River, September 1992: Annual report, 18:33846 (R;US)

Westinghouse Hanford Co., Richland, WA (United States)
100-N Area underground storage tank closures, 18:32304 (R;US)
1991 implementation of As Low As Reasonably Achievable (ALARA) administrative radiation exposure levels: Experiences and lessons learned, 18:33959 (R;US)
1993 Solid Waste Reference Forecast Summary, 18:32499 (R;US)
Barometric pressure variations, 18:32505 (R;US)
Description of work for 100-DR-2 Operable Unit Vadose Drilling/test pits, 18:32514 (R;US)
Description of work for 216-U-Pond cone penetrometer demonstration, 18:32515 (R;US)
Description of work for the 200-UP-1 groundwaters contaminant vertical profiling activity: Revision 1, 18:33831 (R;US)
Developing waste disposal options in the underground storage tank - integrated demonstration program, 18:32512 (R;US)
Fact finding trip to Russia concerning the April 6, 1993 chemical explosion at the Siberian Chemical Combine in order to support a safety review of US facilities: Foreign trip report, June 18–29, 1993, 18:32338 (R;US)
Feasibility of the Shallow High Resolution Seismic Reflection Technique for Use at the Hanford Site, 18:32579 (R;US)
Final report of the systems engineering technical advisory board for the Tank Waste Remediation Program, 18:32509 (R;US)
Geophysical investigation of 218-W-4C trenches #1 and #4, 200 west, 18:32516 (R;US)
Glass melter assembly for the Hanford Waste Vitrification Plant, 18:32513 (R;US)
Hanford Site production reactor data pertinent to actinide burning, 18:32900 (R;US)
Hanford Site Tank Waste Remediation System: Waste management 1993 symposium papers and viewgraphs, 18:32510 (R;US)
Hanford Waste Vitrification Plant Project Waste Form Qualification Program Plan, 18:32498 (R;US)
Integrated test plan for the demonstration of a commercial Fourier Transform Infrared instrument, 18:33697 (R;US)
Long-Term Climate Change Assessment Task for the Hanford Site Permanent Isolation Barrier Development Program: Status through FY 1992, 18:32504 (R;US)
Material-not-categorized-as-waste survey for 1992, 18:32501 (R;US)
Miscellaneous information regarding operation and inventory of 618-11 Burial Ground, 18:32511 (R;US)
Nondestructive testing methods for 55-gallon, waste storage drums, 18:32506 (R;US)
Pretreatment Technology Plan, 18:32502 (R;US)
QA/QC requirements for physical properties sampling and analysis, 18:33832 (R;US)
Quarterly report on Defense Nuclear Facilities Safety Board Recommendation 90-7 for the period ending March 31, 1993, 18:32578 (R;US)
Radionuclide air emissions report for the Hanford Site, calendar year 1992, 18:32531 (R;US)
Reactor vessel shielding with radioactive waste materials as burnable poisons, 18:32812 (R;US)
Summary report on 49 L ferrocyanide aerosol tests TO208-1 and TO209-1, 18:32508 (R;US)
Summary report on parametric pressure propagation test T0127-1, 18:32507 (R;US)
Tank characterization data report: Tank 241-C-112, 18:32503 (R;US)
Tank Farm surveillance and waste status summary report for March 1993, 18:32496 (R;US)
Tank Farm surveillance and waste status summary report for April 1993, 18:32497 (R;US)
Technical evaluation: 300 Area steam line valve accident, 18:33209 (R;US)
The role of aging in resolving the ferrocyanide safety issue, 18:32500 (R;US)
Travel to Europe for program to maintain communications with regional renewable-resource industries: Foreign trip report, January 20–February 7, 1992, 18:33004 (R;US)
Travel to Europe to evaluate remote systems and robotics technology: Foreign trip report, May 1–19, 1992, 18:32542 (R;US)
Travel to France to confer on technological studies and advances in radioactive particulate monitoring for the work place: Foreign trip report, March 24–April 3, 1993, 18:33918 (R;US)
Travel to Japan to witness current proof-of-concept testing activities and perform a quality surveillance on the laboratory procedures: Foreign trip report, February 6–16, 1992, 18:33757 (R;US)
Trip to United Kingdom and France to determine what foreign technology is to be incorporated into the Multipurpose Processing and Storage Complex design: Foreign trip report, April 19–30, 1993, 18:32365 (R;US)
Westinghouse Hanford Company Operational Groundwater status report, 1990–1992, 18:33830 (R;US)
Westinghouse Hanford Company package testing capabilities, 18:33404 (R;US)
[Travel to England, Italy, France and Germany to conduct an evaluation of remote systems and robotics technology specifically applicable to the light-duty utility arm for use in underground storage tanks]: Foreign trip report, May 1–19, 1992, 18:33354 (R;US)

Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States)
CPP-603 Chloride Removal System Decontamination and Decommissioning: Final report, 18:32582 (R;US)
Decontamination of the ICPP main stack, 18:32535 (R;US)
ICPP waste management technology development program, 18:32517 (R;US)
Idaho Chemical Processing Plant safety document ICPP hazardous chemical evaluation, 18:32581 (R;US)

INEL historical dose evaluation: Reconstruction of operational airborne releases of radioactivity to the environment, 18:32536 (R;US)
RSAC-5.1: Radiological Safety Analysis Computer Program, 18:34658 (CM;US)
Technology development program for Idaho Chemical Processing Plant spent fuel and waste management, 18:32518 (R;US)
Travel to Europe to evaluate remote systems and robotics technology: Foreign trip report, May 1–19, 1992, 18:32542 (R;US)
WINCO database program, 18:32583 (R;US)

Westinghouse Savannah River Co., Aiken, SC (United States)
A model of the control rod housing overflow incident in a Savannah River Production Reactor, 18:32947 (R;US)
A review of vapor explosion information pertinent to the SRS reactors, 18:32948 (R;US)
Acceptance criteria for in-service inspection of heat exchanger head and shell components, 18:32901 (R;US)
Accountability measurement precision and accuracy values: How good is good enough?, 18:32615 (R;US)
Alkaline solution absorption of carbon dioxide method and apparatus, 18:33308 (PA;US)
Analysis of SPRIHTE LOPA flow excursion tests, 18:32955 (R;US)
Apparatus for attaching a cleaning tool to a robotic manipulator, 18:33384 (PA;US)
Applications of Quaternary stratigraphic, soil-geomorphic, and quantitative geomorphic analyses to the evaluation of tectonic activity and landscape evolution in the Upper Coastal Plain, South Carolina, 18:33834 (R;US)
Assessment of nuclear safety and nuclear criticality potential in the Defense Waste Processing Facility: Revision 1, 18:32522 (R;US)
Benzene Monitor System report, 18:32525 (R;US)
Characterization of the Defense Waste Processing Facility (DWPF) Environmental Assessment (EA) glass Standard Reference Material: Revision 1, 18:32524 (R;US)
Chemical compatibility of DWPF canistered waste forms: Revision 1, 18:32523 (R;US)
Data Qualification guidelines: Task number 90-053-0, 18:34708 (R;US)
Environmental ALARA Program at the Savannah River Site, 18:33793 (R;US)
Estimates for Pu-239 loadings in burial ground culverts based on fast/slow neutron measurements, 18:32521 (R;US)
Estimation of Ni^{63}, Pu^{241}, Pu^{242} and Am^{243} from Co^{60}, Pu^{239}, and Cm^{244} activities in groundwater samples, 18:33835 (R;US)
F- and H-Area Sewage Sludge Application Sites groundwater monitoring report, 18:33836 (R;US)
F-Area Acid/Caustic Basin Groundwater Monitoring Report: First quarter 1993, 18:33837 (R;US)
Finite difference program for calculating hydride bed wall temperature profiles, 18:33405 (R;US)
Foam technology as a decontamination/waste minimization tool, 18:32520 (R;US)
Four foot septifoil cooling experiment unrestricted inlet/outlet case, 18:32953 (R;US)
Four Mile Creek semi-annual sampling report, January 1993 sampling event, 18:33842 (R;US)
GAM-HEAT – a computer code to compute heat transfer in complex enclosures: Revision 1, 18:32951 (R;US)
H-Area Acid/Caustic Basin groundwater monitoring report, 18:33838 (R;US)
Hazardous Waste/Mixed Waste Treatment Building Safety Information Document (SID), 18:32526 (R;US)
Hazards Assessment Document of the New Waste Transfer Facility (NWTF), 18:32528 (R;US)
Heat exchanger staybolt acceptance criteria: Task number: 90-058-1, 18:32952 (R;US)
Heat exchanger, head and shell acceptance criteria, 18:32904 (R;US)
K-Area Acid/Caustic Basin groundwater monitoring report: First quarter 1993, 18:33839 (R;US)
K-Area and Par Pond Sewage Sludge Application Sites Groundwater Monitoring Report: First quarter 1993, 18:32537 (R;US)
K-FIX(GT): A computer program for modeling the expansion phase of steam explosions within complex three dimensional cavities, 18:32949 (R;US)
Mechanical degradation temperature of waste storage materials, 18:32527 (R;US)
New production reactor flow instability experiments with coolant upflow: Volume 1, Fuel assembly and test facility description, 18:32915 (R;US)
New production reactor flow instability experiments with coolant upflow: Volume 2, Test program and results, 18:32916 (R;US)
Overlay welding irradiated stainless steel, 18:34626 (R;US)
P-Area Acid/Caustic Basin groundwater monitoring report: First quarter 1993, 18:33840 (R;US)
Radmodl Modeling Manual, 18:32950 (R;US)
Re-evaluation of the 1962 Mark VI-B dynamic tests regarding reactivity coefficients, 18:32902 (R;US)
Sanitary Landfill groundwater monitoring report: First quarter 1993, 18:33841 (R;US)
Savannah River Technology Center monthly report, September 1992, 18:32954 (R;US)
Savannah River Technology Center monthly report, March 1993, 18:32797 (R;US)
Solid-state, resistive hydrogen sensors for safety monitoring, 18:33290 (R;US)
Steam stripping of polycyclic aromatics from simulated high-level radioactive waste, 18:32519 (R;US)
The consequences of expansion joint bellows failure, 18:32946 (R;US)
Ultrasonic technique for inspection of GPHS capsule girth weld integrity, 18:32629 (R;US)
Update and extension of Mark 22 energy redistribution factors for HMTABLE: Revision 1, 18:32903 (R;US)
Upset welding process for 21-6-9 spherical vessels, 18:33210 (R;US)
Vitrification of excess plutonium, 18:33742 (R;US)

Weston Geophysical Corp., Westboro, MA (United States)
Geophysical investigation: New Production Reactor Complex, Idaho National Engineering Laboratory, 18:32819 (R;US)

Winter (Steven) Associates, Inc., Norwalk, CT (United States)
Evaluation and demonstration of decentralized space and water heating versus centralized services for new and rehabilitated multifamily buildings: Final report, 18:33046 (R;US)

Winzen International, Inc., San Antonio, TX (United States)
Superpressure stratospheric vehicle: Final report, 11 September 1989 to 06 April 1990, 18:33344 (R;US)

Wisconsin Univ., Madison, WI (United States). Dept. of Physics
Theoretical studies of turbulence and anomalous transport in toroidal confinement devices, 18:34499 (R;US)

Y

Yale Univ., New Haven, CT (United States)
Reactive fluid flow models and applications to diagenesis, mineral deposits and crustal rocks, 18:33971 (R;US)

Yale Univ., New Haven, CT (United States). Dept. of Physics
Task A: Yale Accelerator Users Group (YAUG): Second technical progress report, November 1, 1992–October 31, 1993, 18:34018 (R;US)
Task J: Outstanding Junior Investigator (OJI): Technical progress report, [November 1, 1993–October 31, 1993], 18:34053 (R;US)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.
